

Surface Weather Map Showing Storm System in the Eastern United States

Figure 2. Simplified surface weather map showing a storm system in the eastern US.

Warm air advection occurs where the wind flows across isobars from higher pressure to lower (warmer) values. Thus, warm air is being transported across a certain location by the horizontal winds. Based on this fact alone, one would expect precipitation at that location to be rising, cold air advection occurs where the wind flows across the isobars from lower (colder) values to higher (warmer) values. Thus, colder air being transported by the wind to a certain location produces falling temperatures.

Based on wind directions and the isobars pattern on the Figure 2 map, determine the type of air advection (warm or cold) that would be occurring at each station.

3. Winds at station two are occurring at Station _____.

- ☐ A
- ☐ B
- ☐ C
- ☐ D

4. Could air advection occur occurring at Station _____.

- ☐ B
- ☐ C
- ☐ D

5. Generalizing from the map depiction of wind and temperature patterns associated with weather systems, what is the most likely weather expected at Station _____.

- ☐ warm
- ☐ cold

6. Meanwhile, what is the most and weather at Station can be expected to have _____ air advection.

- ☐ warm
- ☐ cold

7. Areas to the east of Highs should be expected to have _____ air advection.

- ☐ warm
- ☐ cold

8. And while you choose from that only; weather based on the model of a High, areas to the west of Highs should have _____ air advection.

- ☐ warm
- ☐ cold
