Perspectives in Analysis, Geometry, and Topology Ilia Itenberg, Burglind Jöricke, Mikael Passare, 2011-12-13 The articles in this volume are invited papers from the Marcus Wallenberg symposium and focus on research topics that bridge the gap between analysis geometry and topology The encounters between these three fields are widespread and often provide impetus for major breakthroughs in applications Topics include new developments in low dimensional topology related to invariants of links and three and four manifolds Perelman s spectacular proof of the Poincare conjecture and the recent advances made in algebraic complex symplectic and tropical geometry **Geometrical Themes Inspired by the N-body**

Problem Luis Hernández-Lamóneda, Haydeé Herrera, Rafael Herrera, 2018-02-26 Presenting a selection of recent developments in geometrical problems inspired by the N body problem these lecture notes offer a variety of approaches to study them ranging from variational to dynamical while developing new insights making geometrical and topological detours and providing historical references A Guillot s notes aim to describe differential equations in the complex domain motivated by the evolution of N particles moving on the plane subject to the influence of a magnetic field Guillot studies such differential equations using different geometric structures on complex curves in the sense of W Thurston in order to find isochronicity conditions R Montgomery s notes deal with a version of the planar Newtonian three body equation Namely he investigates the problem of whether every free homotopy class is realized by a periodic geodesic The solution involves geometry dynamical systems and the McGehee blow up A novelty of the approach is the use of energy balance in order to motivate the McGehee transformation A Pedroza s notes provide a brief introduction to Lagrangian Floer homology and its relation to the solution of the Arnol d conjecture on the minimal number of non degenerate fixed points of a Hamiltonian diffeomorphism *Issues in Algebra, Geometry, and Topology: 2013 Edition* , 2013-05-01

Mathematics Kishore Marathe, 2010-08-09 As many readers will know the 20th century was a time when the fields of mathematics and the sciences were seen as two separate entities Caused by the rapid growth of the physical sciences and an increasing abstraction in mathematical research each party physicists and mathematicians alike suffered a misconception not only of the opposition s theoretical underpinning but of how the two subjects could be intertwined and effectively utilized One sub discipline that played a part in the union of the two subjects is Theoretical Physics Breaking it down further came the fundamental theories Relativity and Quantum theory and later on Yang Mills theory Other areas to emerge in this area are those derived from the works of Donaldson Chern Simons Floer Fukaya and Seiberg Witten Aimed at a wide audience Physical Topics in Mathematics demonstrates how various physical theories have played a crucial role in the developments of Mathematics and in particular Geometric Topology Issues are studied in great detail and the book steadfastly covers the background of both Mathematics and Theoretical Physics in an effort to bring the reader to a deeper understanding of their interaction Whilst the world of Theoretical Physics and Mathematics is boundless it is not the intention of this book to cover its enormity Instead it seeks to lead the reader through the world of Physical Mathematics leaving them with a choice of which realm they wish to visit next *Banach Spaces and Descriptive Set Theory: Selected Topics* Pandelis

Dodos, 2010-04-15 These notes are devoted to the study of some classical problems in the Geometry of Banach spaces The novelty lies in the fact that their solution relies heavily on techniques coming from Descriptive Set Theory The central theme is universality problems In particular the text provides an exposition of the methods developed recently in

order to treat questions of the following type Q Let $\mathcal{C}$ be a class of separable Banach spaces such that every space X in the class $\mathcal{C}$ has a certain property say property P When can we find a separable Banach space Y which has property P and contains an isomorphic copy of every member of $\mathcal{C}$ We will consider quite classical properties of Banach spaces such as being reflexive having separable dual not containing an isomorphic copy of c_0 being non universal etc 0 It turns out that a positive answer to problem Q for any of the above mentioned properties is possible if and essentially only if the class $\mathcal{C}$ is simple The simplicity of $\mathcal{C}$ is measured in set theoretic terms Precisely if the class $\mathcal{C}$ is analytic in a natural coding of separable Banach spaces then we can indeed find a separable space Y which is universal for the class $\mathcal{C}$ and satisfies the requirements imposed above

Morrey and Campanato Meet Besov, Lizorkin and Triebel Wen Yuan, Winfried Sickel, Dachun YANG, 2010-09-18 During the last 60 years the theory of function spaces has been a subject of growing interest and increasing diversity Based on three formally different developments namely the theory of Besov and Triebel Lizorkin spaces the theory of Morrey and Campanato spaces and the theory of Q spaces the authors develop a unified framework for all of these spaces As a byproduct the authors provide a completion of the theory of Triebel Lizorkin spaces when p *Paris-Princeton Lectures on Mathematical Finance 2010* Areski Cousin, Stéphane Crépey, Olivier Guéant, David Hobson, Monique Jeanblanc, Jean-Michel Lasry, Jean-Paul Laurent, Pierre-Louis Lions, Peter Tankov, 2011-06-29 The Paris Princeton Lectures in Financial Mathematics of which this is the fourth volume publish cutting edge research in self contained expository articles from outstanding specialists established or on the rise The aim is to produce a series of articles that can serve as an introductory reference source for research in the field The articles are the result of frequent exchanges between the finance and financial mathematics groups in Paris and Princeton The present volume sets standards with five articles by 1 Areski Cousin Monique Jeanblanc and Jean Paul Laurent 2 Stéphane Crépey 3 Olivier Guéant Jean Michel Lasry and Pierre Louis Lions 4 David Hobson and 5 Peter Tankov

Arithmetic Geometry Jean-Louis Colliot-Thélène, Peter Swinnerton-Dyer, Paul Vojta, 2010-10-27 Arithmetic Geometry can be defined as the part of Algebraic Geometry connected with the study of algebraic varieties through arbitrary rings in particular through non algebraically closed fields It lies at the intersection between classical algebraic geometry and number theory A C I M E Summer School devoted to arithmetic geometry was held in Cetraro Italy in September 2007 and presented some of the most interesting new developments in arithmetic geometry This book collects the lecture notes which were written up by the speakers The main topics concern diophantine equations local global principles diophantine approximation and its relations to Nevanlinna theory and rationally connected varieties The book is divided into three parts corresponding to the courses given by J L Colliot Thelene Peter Swinnerton Dyer and Paul Vojta The Analysis of Fractional Differential Equations Kai Diethelm, 2010-09-03 Fractional calculus was first developed by pure mathematicians in the middle of the 19th century Some 100 years later engineers and physicists have found applications for these concepts in their areas However there has traditionally been little interaction between these two communities In particular typical mathematical works

provide extensive findings on aspects with comparatively little significance in applications and the engineering literature often lacks mathematical detail and precision This book bridges the gap between the two communities It concentrates on the class of fractional derivatives most important in applications the Caputo operators and provides a self contained thorough and mathematically rigorous study of their properties and of the corresponding differential equations The text is a useful tool for mathematicians and researchers from the applied sciences alike It can also be used as a basis for teaching graduate courses on fractional differential equations

Lévy Matters I Thomas Duquesne, Oleg Reichmann, Ken-iti Sato, Christoph Schwab, 2010-09-05 Focusing on the breadth of the topic this volume explores Lévy processes and applications and presents the state of the art in this evolving area of study These expository articles help to disseminate important theoretical and applied research to those studying the field

Mathematical Models in the Manufacturing of Glass Angiolo Farina, Axel Klar, Robert M.M. Mattheij, Andro Mikelić, Norbert Siedow, 2010-11-27 This volume presents a review of advanced technological problems in the glass industry and of the mathematics involved It is amazing that such a seemingly small research area is extremely rich and calls for an impressively large variety of mathematical methods including numerical simulations of considerable complexity The problems treated here are very typical of the field of glass manufacturing and cover a large spectrum of complementary subjects injection molding by various techniques radiative heat transfer in glass nonisothermal flows and fibre spinning The book can certainly be useful not only to applied mathematicians but also to physicists and engineers who can find in it an overview of the most advanced models and methods

Symmetries of Compact Riemann Surfaces Emilio Bujalance García, Francisco Javier Cirre, José Manuel Gamboa, Grzegorz Gromadzki, 2010-10-06 This monograph deals with symmetries of compact Riemann surfaces A symmetry of a compact Riemann surface S is an antianalytic involution of S It is well known that Riemann surfaces exhibiting symmetry correspond to algebraic curves which can be defined over the field of real numbers In this monograph we consider three topics related to the topology of symmetries namely the number of conjugacy classes of symmetries the numbers of ovals of symmetries and the symmetry types of Riemann surfaces

Séminaire de Probabilités XLIII Catherine Donati Martin, Antoine Lejay, Alain Rouault, 2010-10-28 This is a new volume of the Séminaire de Probabilités which is now in its 43rd year Following the tradition this volume contains about 20 original research and survey articles on topics related to stochastic analysis It contains an advanced course of J Picard on the representation formulae for fractional Brownian motion The regular chapters cover a wide range of themes such as stochastic calculus and stochastic differential equations stochastic differential geometry filtrations analysis on Wiener space random matrices and free probability as well as mathematical finance Some of the contributions were presented at the Journées de Probabilités held in Poitiers in June 2009

The Use of Ultraproducts in Commutative Algebra Hans Schoutens, 2010-07-31 Exploring ultraproducts of Noetherian local rings from an algebraic perspective this volume illustrates the many ways they can be used in commutative algebra The text includes an introduction to tight closure

in characteristic zero a survey of flatness criteria and more *Holomorphic Dynamical Systems* Nessim Sibony, Dierk Schleicher, Dinh Tien Cuong, Marco Brunella, Eric Bedford, Marco Abate, 2010-07-31 The theory of holomorphic dynamical systems is a subject of increasing interest in mathematics both for its challenging problems and for its connections with other branches of pure and applied mathematics A holomorphic dynamical system is the datum of a complex variety and a holomorphic object such as a self map or a vector field acting on it The study of a holomorphic dynamical system consists in describing the asymptotic behavior of the system associating it with some invariant objects easy to compute which describe the dynamics and classify the possible holomorphic dynamical systems supported by a given manifold The behavior of a holomorphic dynamical system is pretty much related to the geometry of the ambient manifold for instance parabolic manifolds do not admit chaotic behavior while projective manifolds have a variety of different chaotic pictures The techniques used to tackle such problems are of various kinds complex analysis methods of real analysis pluripotential theory algebraic geometry differential geometry topology To cover all the possible points of view of the subject in a unique occasion has become almost impossible and the CIME session in Cetraro on Holomorphic Dynamical Systems was not an exception

Controllability of Partial Differential Equations Governed by Multiplicative Controls Alexander Y.

Khapalov, 2010-05-19 This monograph addresses the global controllability of partial differential equations in the context of multiplicative or bilinear controls which enter the model equations as coefficients The methodology is illustrated with a variety of model equations Geometric Theory of Discrete Nonautonomous Dynamical Systems Christian

Pötzsche, 2010-09-17 The goal of this book is to provide an approach to the corresponding geometric theory of nonautonomous discrete dynamical systems in infinite dimensional spaces by virtue of 2 parameter semigroups processes

Intersection Spaces, Spatial Homology Truncation, and String Theory Markus Banagl, 2010-06-16 Intersection cohomology assigns groups which satisfy a generalized form of Poincaré duality over the rationals to a stratified singular space This monograph introduces a method that assigns to certain classes of stratified spaces cell complexes called intersection spaces whose ordinary rational homology satisfies generalized Poincaré duality The cornerstone of the method is a process of spatial homology truncation whose functoriality properties are analyzed in detail The material on truncation is autonomous and may be of independent interest to homotopy theorists The cohomology of intersection spaces is not isomorphic to intersection cohomology and possesses algebraic features such as perversity internal cup products and cohomology operations that are not generally available for intersection cohomology A mirror symmetric interpretation as well as applications to string theory concerning massless D branes arising in type IIB theory during a Calabi-Yau conifold transition are discussed
