

SOUND WAVES

Sound wave travel as transfer of transmission of energy through a medium in the form of disturbance. It requires the disturbance/oscillation instead of the particles of the medium disturbance/oscillation/pressure/vibration/energy from one particle to adjacent.

The waves are of three types – mechanical, electromagnetic and matter waves. Mechanical waves require a physical medium and travel within medium, basically within the matter medium. sound waves and seismic waves are mechanical waves of this type. Electromagnetic waves do not require any physical medium for propagation. Radio waves, microwaves, infrared rays, visible light, the ultraviolet rays, X rays, gamma rays are electromagnetic waves. The waves exhibit different properties like reflection, refraction, diffraction, polarization, interference and other things.

Characteristics of sound waves:

- Pressure variation is a form of disturbance traveling in the medium along the parallel direction of the disturbance/oscillation/pressure variation.
- It is necessary that the medium should possess elasticity and inertia.
- Medium particles of the medium, move back and forth perpendicular direction toward & away particle begins to vibrate in time longer than the disturbance.
- Two waves move with different particle velocity. The velocity of a wave is constant for a given medium, whereas the velocity of the particles goes on changing and is sinusoidal/oscillatory in their motion particle velocity is time dependent.
- During the propagation of wave density, mass transfer of energy from one particle to other but without any transmission of the particles of the medium.
- The wave exhibits reflection, refraction, diffraction and polarization.

Two kinds of sound waves:

- Longitudinal wave or transverse
- Transverse wave

Longitudinal wave:

Sound. Transverse waves travel in the form of transverse pulses. The disturbance/oscillation of the particle is the perpendicular to the direction of wave.

Transverse wave:

Light. Transverse waves travel in the form of transverse pulses. The disturbance/oscillation of the particle is the perpendicular to the direction of wave. Light waves are called transverse waves. Examples of transverse waves are waves propagating electromagnetic waves, etc.
