Collacott, 2012-12-06 Although the most sophisticated fault diagnosis and condition monitoring systems have their origin in the aerospace and nuclear energy industries their use is by no means restricted to such areas of high technology Modern machinery in most industrial plants is now so complex and expensive that mechanics find it increasingly difficult to detect failure by for instance recognising changes in sound signatures and few plants can afford the luxury of regular stripping down Increasingly therefore early warning devices are being employed in an effort to prevent catastrophic breakdown This book provides the first coordinated compilation of fault diagnosis and condition monitoring devices It proceeds in three logical steps The early chapters deal with those conditions which contribute to deterioration and the consequent likely development of faults The middle part of the book considers the various techniques of monitoring and discusses the criteria for their selection in different situations The final chapters provide a guide to the

interpretation of the information signals deriving from monitoring relating to reliability science and the mathematics of probability and thus providing decision data on which management can act *Modeling and Estimation of Structural Damage* Jonathan M. Nichols, Kevin D. Murphy, 2016-01-08 Modelling and Estimation of Damage in Structures is a comprehensive guide to solving the type of modelling and estimation problems associated with the physics of structural damage Provides a model based approach to damage identification Presents an in depth treatment of probability theory and random processes Covers both theory and algorithms for implementing maximum likelihood and Bayesian estimation approaches Includes experimental examples of all detection and identification approaches Provides a clear means by which acquired data can be used to make decisions regarding maintenance and usage of a structure
