

THERMAL ENERGY READINGS & QUESTIONS

Types of Heat Transfer

Temperature differences are not as we realize for the air conditions convection, and radiation.

Convection is heat transfer by the movement of the fluid. As air is heated, it expands and the air particles move apart, they make it rise. This is because they are taking up more space. As air rises and the cooler air sinks, a hot air balloon is made. This makes the air within the balloon expand. Convection also occurs in water. Convection is found in your car, your house, your body. Cooler water

Radiation is heat transfer by the form of electromagnetic waves. Thermal energy is transferred by waves, causing the particles to vibrate.

Particle Arrangement

To understand how heat moves, we need to know how particles are arranged. On Earth, all matter is made up of particles. These particles are always moving. Phase is determined by the arrangement of particles.

Thermal Equilibrium

Particles are always vibrating and this vibrating motion produces thermal energy. All matter is constantly vibrating, so all matter has some amount of thermal energy. Heat transfer is how thermal energy moves from one place to another. Lucky for us, it is easy to predict how heat moves. Thermal energy will always travel from warmer objects to cooler objects until the energy is equally distributed. When you have two objects that are at different temperatures, thermal energy moves from the warmer object to the cooler object until they are both at the same temperature. This is called thermal equilibrium. Thermal energy continues to move until equilibrium is established, returning to its resting thermal equilibrium.
