Thermistors Experiment:

Tank Pressure Control Experiment: Thermal Phenomena in Microgravity Mohammad M. Hasan,1996

Experimental Determination of Heat Transfer Coefficients in Water Flowing Over a Horizontal Ice Sheet Virgil J. Lunardini,1986 Experiments to study the melting of a horizontal ice sheet with a flow of water above it were conducted in a 35 m long refrigerated flume with a cross section of 1.2x1.2 m. Water depth, temperature and velocity were varied as well as the temperature and initial surface profile of the ice sheet. The heat transfer regimes were found to consist of forced turbulent flow at high Reynolds numbers with a transition to free convection heat transfer. There was no convincing evidence of a forced laminar regime. The data were correlated for each of the regimes with the Reynolds number Re or the Grashof number combined with the Reynolds number as $Gr Re$ to the $2/5$ power used to characterize the different kinds of heat transfer. For water flowing over a horizontal ice sheet the melting heat flux for low flow velocities was not found to drop below the value for the free convection case 488.5 W/m^2 as long as the water temperature exceeds 3.4°C . This is significant since the free convection melt values far exceed those for laminar forced convection. At the low flow velocities the melting flux was not dependent upon the fluid temperature until the water temperature dropped below 3.4°C when $q_{\text{sub}} = 135.7 \Delta T$. In general the heat transfer was found to significantly exceed that of non melting systems for the same regimes. This was attributed to increased free stream turbulence, thermal instability due to the density maximum of water near 4°C and the turbulent eddies associated with the generation of a wavy ice surface during the melting. *Experimental Physical Chemistry* Arthur Halpern, George McBane, 2006-06-30. Report on the Effect of Nuclear Radiation on Transducers W. E. Chapin, Donald J. Hamman, E. N. Wyler, 1963 **Journal of Research of the National Bureau of Standards**, 1988 Sealing of Boreholes and Underground Excavations in Rock K. Fuenkajorn, J. J. Daemen, 2012-12-06. Sealing of boreholes and underground excavations has not received much engineering attention until fairly recently. The growing awareness of and sensitivity to environmental concerns of the technical community as well as of the public at large has resulted in an increasing recognition of the fact that these geological penetrations may have an environmental impact. The issue of possible contamination resulting from migration along boreholes, adits, shafts or tunnels unquestionably has been raised most forcefully within the context of nuclear waste disposal. Several nuclear waste disposal programs, notably the Civilian and the Defence programs of the US Department of Energy, the US Nuclear Regulatory Commission and the Canadian and Swedish radioactive waste disposal programs have conducted major research efforts aimed at developing adequate seal designs for penetrations in host rock formations for high level nuclear waste repositories. While a considerable data base has been gathered over the last two decades or so with regard to the performance of seals, most of the information is presented in research reports and widely scattered papers in journals and

proceedings of conferences Hence the materials are not readily accessible to potential users such as designers contractors or regulators who are not familiar with nuclear waste disposal programs Boron Synthesis, Structure, and Properties Jack Arnold Kohn,W.F.
