Exploring Sources of Variability Related to the Clinical Translation of Regenerative Engineering Products National Academies of Sciences, Engineering, and Medicine, Health and Medicine Division, Board on Health Sciences Policy, Forum on Regenerative Medicine, 2019-07-19 The emerging multidisciplinary field of regenerative engineering is devoted to the repair regeneration and replacement of damaged tissues or organs in the body To accomplish this it uses a combination of principles and

technologies from disciplines such as advanced materials science developmental and stem cell biology immunology physics and clinical translation The term regenerative engineering reflects a new understanding of the use of tissue engineering for regeneration and also the growing number of research and product development efforts that incorporate elements from a variety of fields Because regenerative engineered therapies rely on live cells and scaffolds there are inherent challenges in quality control arising from variability in source and final products Furthermore each patient recipient tissue donor and product application is unique meaning that the field faces complexities in the development of safe and effective new products and therapies which are not faced by developers of more conventional therapies Understanding the many sources of variability can help reduce this variability and ensure consistent results The Forum on Regenerative Medicine hosted a public workshop on October 18 2018 in Washington DC to explore the various factors that must be taken into account in order to develop successful regenerative engineering products Invited speakers and participants discussed factors and sources of variability in the development and clinical application of regenerative engineering products characteristics of high quality products and how different clinical needs models and contexts can inform the development of a product to improve patient outcomes This publication summarizes the presentation and discussion of the workshop *Tissue and Organ Regeneration* Lijie Grace Zhang, Ali Khademhosseini, Thomas Webster, 2016-04-19 Tissue engineering aims to develop biological substitutes that restore maintain or improve damaged tissue and organ functionality To date numerous stem cells and biomaterials have been explored for a variety of tissue and organ regeneration The challenge for existing stem cell based techniques is that current therapies lack controlled environm
