

V-BELT DRIVE SYSTEM

No gear shifting is required because the reduction ratio automatically changes with the engine speed. Stable climbing ability and smooth acceleration are ensured, independent of the rider's driving technique.

OPERATION

Starting off

The V-belt is positioned near the center of the primary sheave and near the perimeter of the secondary sheave at the same time.

With the V-belt in this position, the reduction ratio is maximum so that full engine torque can be transmitted to the rear wheel. (Greater torque can be transmitted.)

Stall r/min: 3,500

At medium speeds

As the engine speed increases, the sheave weights are thrown outward by centrifugal force, and the weights force the movable sheave inward. This means that on the primary sheave, the V-belt is forced toward the perimeter of the primary sheave and on the secondary sheave, the belt moves toward the center of the sheave. In other words, the reduction ratio decreases slowly and thus the secondary sheave speed increases.
