Auditory and Vestibular Efferents

A stylized illustration in light green and yellow on a teal background. It depicts the auditory and vestibular systems. On the left, there are three horizontal, elongated structures representing the cochlea. On the right, there are two bulbous structures representing the vestibular system. Thin, wavy lines connect these structures, suggesting neural pathways or efference copies. The overall style is scientific and artistic.

The Vestibular System Springer Handbook Of Auditory Research:

The Vestibular System Stephen M. Highstein, Richard R. Fay, 2006-04-18 The Springer Handbook of Auditory Research presents a series of comprehensive and synthetic reviews of the fundamental topics in modern auditory research. The volumes are aimed at all individuals with interests in hearing research including advanced graduate students, postdoctoral researchers, and clinical investigators. The volumes are intended to introduce new investigators to important aspects of hearing science and to help established investigators to better understand the fundamental theories and data in fields of hearing that they may not normally follow closely. Each volume is intended to present a particular topic comprehensively and each chapter will serve as a synthetic overview and guide to the literature. As such, the chapters present neither exhaustive data reviews nor original research that has not yet appeared in peer-reviewed journals. The volumes focus on topics that have developed a solid data and conceptual foundation rather than on those for which a literature is only beginning to develop. New research areas will be covered on a timely basis in the series as they begin to mature. **Vestibular system** Hans Helmut Kornhuber, 2014-01-15

Development of Auditory and Vestibular Systems Raymond Romand, Isabel Varela-Nieto, 2014-05-23 Development of Auditory and Vestibular Systems fourth edition presents a global and synthetic view of the main aspects of the development of the stato-acoustic system. Unique to this volume is the joint discussion of two sensory systems that although close at the embryological stage present divergences during development and later reveal conspicuous functional differences at the adult stage. This work covers the development of auditory receptors up to the central auditory system from several animal models including humans. Coverage of the vestibular system spanning amphibians to effects of altered gravity during development in different species offers examples of the diversity and complexity of life at all levels from genes through anatomical form and function to ultimately behavior. The new edition of Development of Auditory and Vestibular Systems will continue to be an indispensable resource for beginning scientists in this area and experienced researchers alike. Full color figures illustrate the development of the stato-acoustic system pathway. Covers a broad range of species from Drosophila to humans demonstrating the diversity of morphological development despite similarities in molecular processes involved at the cellular level. Discusses a variety of approaches from genetic molecular biology to psychophysics enabling the investigation of ontogenesis and functional development. Development of Auditory and Vestibular Systems-3: Molecular Development of the Inner Ear Raymond Romand, Isabel

Varela-Nieto, 2003-12-15 Thanks to advances in genetics and genomics research on inner ear development has flourished. Better approaches and experimental models have shed light on the function of a variety of vertebrate genes and their related proteins. This latest volume of Current Topics in Developmental Biology delves into this new research to show how the discovery of more genes involved in the development of the inner ear leads to the generation of new models that examine a wealth of issues from the origins of human deafness to the roles of genes during inner ear induction, development, and

differentiation The wide variety of experimental approaches will help readers to understand the broad range of issues related to inner ear morphogenesis and other concepts from complementary areas of investigation This state of the art overview will be essential reading for researchers clinicians and students alike Scores of high quality full color figures Detailed schemes on the structure and timing of ear development Current Topics in Developmental Biology is the longest running forum for contemporary issues in developmental biology Baloh and Honrubia's Clinical Neurophysiology of the Vestibular System
