Wireless Sensor Networks Elena Gaura, Lewis Girod, James Brusey, Michael Allen, Geoffrey Challen, 2010-09-14 The twentieth century ended with the vision of smart dust a network of wirelessly connected devices whose size would match that of a dust particle each one a self contained package equipped with sensing computation communication and power Smart dust held the promise to bridge the physical and digital worlds in the most unobtrusive manner blending together realms that were previously considered well separated Applications involved scattering hundreds or even thousands of smart dust devices to monitor various environmental quantities in scenarios ranging from habitat monitoring to disaster management The devices were envisioned to self organize to accomplish their task in the most efficient way As such smart dust would become a powerful tool assisting the daily activities of scientists and engineers in a wide range of disparate disciplines Wireless sensor networks WSNs as we know them today are the most noteworthy attempt at implementing the smart dust vision In the last decade this field has seen a fast growing investment from both academia and industry Significant financial resources and manpower have gone into making the smart dust vision a reality through WSNs Yet we still cannot claim complete success At present only specialist computer scientists or computer engineers have the necessary background to walk the road from conception to a fully deployed and running WSN system
