Three-dimensional Geometry and Topology William P. Thurston, 1997 Every mathematician should be acquainted with the basic facts about the geometry of surfaces of two dimensional manifolds The theory of three dimensional manifolds is much more difficult and still only partly understood although there is ample evidence that the theory of three dimensional manifolds is one of the most beautiful in the whole of mathematics This excellent introductory work makes this mathematical wonderland remained rather inaccessible to non specialists The author is both a leading researcher with a formidable geometric intuition and a gifted expositor His vivid descriptions of what it might be like to live in this or that three dimensional manifold bring the subject to life Like Poincaré he appeals to intuition but his enthusiasm is infectious and should make many converts for this kind of mathematics There are good pictures plenty of exercises and problems and the reader will find a selection of topics which are not found in the standard repertoire This book contains a great deal of interesting mathematics

Geometry, Topology And Dynamics Of Character Varieties William Goldman, Caroline Series, Ser Peow Tan, 2012-06-18 This volume is based on lectures given at the highly successful three week Summer School on Geometry Topology and Dynamics of Character Varieties held at the National University of Singapore's Institute for Mathematical Sciences in July 2010 Aimed at graduate students in the early stages of research the edited and refereed articles comprise an excellent introduction to the subject of the program much of which is otherwise available only in specialized texts Topics include hyperbolic structures on surfaces and their degenerations applications of ping pong lemmas in various contexts introductions to Lorentzian and complex hyperbolic geometry and representation varieties of surface groups into $PSL(2, \mathbb{C})$ and other semi simple Lie groups This volume will serve as a useful portal to students and researchers in a vibrant and multi faceted area of mathematics

Introduction to 3-Manifolds Jennifer Schultens, 2014-05-21 This book grew out of a graduate course on 3 manifolds and is intended for a mathematically experienced audience that is new to low dimensional topology The exposition begins with the definition of a manifold explores possible additional structures on manifolds discusses the classification of surfaces introduces key foundational results for 3 manifolds and provides an overview of knot theory It then continues with more specialized topics by briefly considering triangulations of 3 manifolds normal surface theory and Heegaard splittings The book finishes with a discussion of topics relevant to viewing 3 manifolds via the curve complex With about 250 figures and more than 200 exercises this book can serve as an excellent overview and starting point for the study of 3 manifolds

A Century in Books Princeton University Press Staff, 2021-10-12 It all began atop a drugstore in Princeton New Jersey in November 1905 From its modest beginnings Princeton University Press was to become one of the world's most important scholarly publishers embracing a wealth of disciplines that have enriched our cultural academic and scientific landscape Both as a tribute to our authors and to celebrate our centenary Princeton University Press here presents A Century in Books This beautifully designed volume highlights 100 of the nearly 8 000 books we have

published. Necessarily winnowed from a much larger list, these books best typify what has been most lasting, most defining, and most distinctive about our publishing history from Einstein's *The Meaning of Relativity* (1922) to the numerous mathematical and other works that marked the Press's watershed decade of the 1940s, including von Neumann and Morgenstern's *Theory of Games and Economic Behavior*, from milestones of literary criticism by Erich Auerbach and Northrop Frye to George Kennan's Pulitzer Prize-winning book on Soviet-American relations, from Milton Friedman and Anna Jacobson Schwartz's *A Monetary History of the United States, 1867-1960* to more recent landmarks such as Luca Cavalli Sforza's *Genes, Men, and the Environment* and Alberto Piazza's *The History and Geography of Human Genes*, and Robert Shiller's *Irrational Exuberance*. In addition to succinct descriptions of the 100 titles and a short introduction on the history of the Press, the book features five essays by prominent scholars and writers. Michael Wood discusses the impact on Princeton University Press of intellectuals who fled Nazi Germany and authored many influential books. Anthony Grafton recounts our rich publishing tradition in history, politics, and culture. Sylvia Nasar traces our evolution into a leading voice in economics publishing. Daniel Kevles reflects on Einstein, a figure of special importance to Princeton. And Lord Robert May writes on our long-standing tradition of publishing in mathematics and science. *A Century in Books* is more than a celebration of 100 years of publishing at Princeton University Press; it is a treasure trove of 100 years of books that have added to the richness of twentieth-century intellectual life.

Ricci Flow and Geometric Applications Michel Boileau, Gerard Besson, Carlo Sinestrari, Gang Tian, 2016-09-09

Presenting some impressive recent achievements in differential geometry and topology, this volume focuses on results obtained using techniques based on Ricci flow. These ideas are at the core of the study of differentiable manifolds. Several very important open problems and conjectures come from this area, and the techniques described herein are used to face and solve some of them. The book's four chapters are based on lectures given by leading researchers in the field of geometric analysis and low-dimensional geometry/topology, respectively, offering an introduction to the differentiable sphere theorem, G. Besson, the geometrization of 3-manifolds, M. Boileau, the singularities of 3-dimensional Ricci flows, C. Sinestrari, and K. Hler, Ricci flow, G. Tian. The lectures will be particularly valuable to young researchers interested in differential manifolds.

Fundamentals of Hyperbolic Manifolds Richard Douglas Canary, Albert Marden, D. B. A. Epstein, 2006-04-13. Presents reissued articles from two classic sources on hyperbolic manifolds. Part I is an exposition of Chapters 8 and 9 of Thurston's pioneering Princeton Notes; there is a new introduction describing recent advances with an up-to-date bibliography giving a contemporary context in which the work can be set. Part II expounds the theory of convex hull boundaries and their bending laminations. A new appendix describes recent work. Part III is Thurston's famous paper that presents the notion of earthquakes in hyperbolic geometry and proves the earthquake theorem. The final part introduces the theory of measures on the limit set, drawing attention to related ergodic theory and the exponent of convergence. The book will be welcomed by graduate students and professional mathematicians who want a rigorous introduction to some basic tools essential for the

modern theory of hyperbolic manifolds **The Shape of Space** Jeffrey R. Weeks, 2001-12-12 Maintaining the standard of excellence set by the previous edition this textbook covers the basic geometry of two and three dimensional spaces Written by a master expositor leading researcher in the field and MacArthur Fellow it includes experiments to determine the true shape of the universe and contains illustrated examples and engaging exercises that teach mind expanding ideas in an intuitive and informal way Bridging the gap from geometry to the latest work in observational cosmology the book illustrates the connection between geometry and the behavior of the physical universe and explains how radiation remaining from the big bang may reveal the actual shape of the universe **Finite Möbius Groups, Minimal Immersions of Spheres, and Moduli** Gabor Toth, 2012-12-06 Spherical soap bubbles isometric minimal immersions of round spheres into round spheres or spherical immersions for short belong to a fast growing and fascinating area between algebra and geometry This theory has rich interconnections with a variety of mathematical disciplines such as invariant theory convex geometry harmonic maps and orthogonal multiplications In this book the author traces the development of the study of spherical minimal immersions over the past 30 plus years including Takahashi's 1966 proof regarding the existence of isometric minimal immersions DoCarmo and Wallach's study of the uniqueness of the standard minimal immersion in the seventies and more recently he examines the variety of spherical minimal immersions which have been obtained by the equivariant construction as $SU(2)$ orbits first used by Mashimo in 1984 and then later by DeTurck and Ziller in 1992 In trying to make this monograph accessible not just to research mathematicians but mathematics graduate students as well the author included sizeable pieces of material from upper level undergraduate courses additional graduate level topics such as Felix Klein's classic treatise of the icosahedron and a valuable selection of exercises at the end of each chapter **Hyperbolic Knot Theory** Jessica S. Purcell, 2020-10-06 This book provides an introduction to hyperbolic geometry in dimension three with motivation and applications arising from knot theory Hyperbolic geometry was first used as a tool to study knots by Riley and then Thurston in the 1970s By the 1980s combining work of Mostow and Prasad with Gordon and Luecke it was known that a hyperbolic structure on a knot complement in the 3 sphere gives a complete knot invariant However it remains a difficult problem to relate the hyperbolic geometry of a knot to other invariants arising from knot theory In particular it is difficult to determine hyperbolic geometric information from a knot diagram which is classically used to describe a knot This textbook provides background on these problems and tools to determine hyperbolic information on knots It also includes results and state of the art techniques on hyperbolic geometry and knot theory to date The book was written to be interactive with many examples and exercises Some important results are left to guided exercises The level is appropriate for graduate students with a basic background in algebraic topology particularly fundamental groups and covering spaces Some experience with some differential topology and Riemannian geometry will also be helpful **Mathematical Foundations of Computer Science 2005** Joanna Jedrzejowicz, 2005-08-17 This book constitutes the refereed proceedings of the 30th International

Symposium on Mathematical Foundations of Computer Science MFCS 2005 held in Gdansk Poland in August September 2005 The 62 revised full papers presented together with full papers or abstracts of 7 invited talks were carefully reviewed and selected from 137 submissions All current aspects in theoretical computer science are addressed ranging from quantum computing approximation automata circuits scheduling games languages discrete mathematics combinatorial optimization graph theory networking algorithms and complexity to programming theory formal methods and mathematical logic
