

FLS Gate Valve

Description

The FLS gate valve is part of the Cameron F-Series valves which have been supplied for production and drilling service since 1958. Many of the features of the FLS are common to the original Type F gate valve, such as full and internally flush bore, forged construction, metal-to-metal sealing, slab gate and simplicity of design. In other areas such as seat seals and stem seal, the FLS design takes advantage of the latest technology in materials and design.

The FLS has been designed with the highest performance in service conditions of any gate valve Cameron has offered. It is the most extensively tested gate valve design Cameron has produced. The FLS has become an industry standard for high pressure, high temperature, gas service, and abrasive and corrosive conditions. It is a preferred choice throughout the world for critical service application, from subsea trees in the North Sea and the Gulf of Mexico to high-temperature gas wells in Indonesia, the Middle East, and South America.

DESIGN FEATURES AND BENEFITS

- **Metal to Metal Sealing** - Sealing gate-to-seat and seat-to-body is metal-to-metal. Seal surfaces on both sides of the seats and gate are lapped to ensure gas tight sealing without sealant. Lubricant is used to limit wear, friction, and intrusion of contaminants into the valve cavity, not as an aid to sealing. No sealant is required or recommended for the FLS gate valve.
- **Reliability through Simplicity of Design** - Two-piece floating seats and a floating slab gate provide reliable performance through simplicity of operation and a minimum of sealing interfaces. Cavity clearances are carefully controlled to limit the amount of float needed, and special modified acme threads at the gate-to-stem connection provide sufficient freedom of movement in all directions to effect a positive downstream seal.
- **Bi-directional Sealing** - The FLS valve is a truly symmetrical, bi-directional design without a preferred direction of operation. The seal diameters and bearing areas of the seats are designed to prevent trapping of pressure inside the valve cavity.
- **Stem Backseat** - The FLS incorporates a metal-to-metal stem backseat which can be energized to isolate the stem packing stuffing box from line pressure. The bonnet grease fitting port can be used to test the backseat integrity, and the stem packing can be replaced with the valve cavity under pressure.

- **Stem Packing** - Several stem packing designs are available to cover the full range of temperatures, pressure, and fluids encountered in service. The selected packing is the Varipak packing, a non-elastomeric seal. The seal is spring-loaded and pressure-energized, so that no longitudinal preload or precise space out is required. Sealant injection is neither required nor recommended for the Varipak stem seal. The seal has been extensively tested in laboratory fixtures with applications of temperature cycles, pressure cycles, and both rotary and linear mechanical actuation cycles.
