technology have proven inadequate Conventional data integration approaches are based on database systems that represent data semantics using static structured data schemas They cannot provide adequate facilities to satisfy the increasing need for effective and efficient application data integration from heterogeneous data sources Applications need to be built on an information model that is standards based flexible and adaptable This research proposes a framework that adopts a semi structured data integration approach using a data view mechanism and XML and XPath standards A prototype of the framework is designed and implemented using a loosely coupled mediator agent adapter architecture based on distributed component technology An XML query language provides the basis for data view definition as well as query specification and transformation A denotational semantics and an abstract syntax of the query language are defined here to provide a formal basis for implementation of query processing and logical query optimization The mapping between the concrete XML syntax and the abstract syntax of the query language is defined to facilitate implementation of query processing The XMark benchmark for XML databases is used to assess the functionality and performance of the prototyped implementation of the query language and system The benchmarking result and analysis establish a base line query performance measure for the proposed data integration framework and identify the characteristics of different system implementations **ebXML**
