Vibration Absorber For Beam:

Vibration Analysis of Simply Supported Beam-type Vibration Absorber Mothanna Yassen Abd, 2010 Beam type structures have wide applications for example civil or mechanical engineering A simply supported beam is widely used in many areas like bridges and double beam structures Excessive vibration in such structures especially at the resonance can cause the structural failure There are two techniques for suppressing the vibration in the beam structures that have been studied previously conventional and continuous vibration absorbers A beam type vibration absorber is one of the continuous vibration absorber applications and it is used to suppress the vibration of the main beam Solving the vibration problem of such kind of structure is difficult and complicated because the motion equations of the system are coupled The equations cannot be analytically solved before decoupling them Therefore some mathematical transformation and variables variation methods were considered to solve this problem but it is still under the limitation of identical beams This means that the analytical method is valid just for identical beams The main objective of this research study is to propose an easy and efficient method to solve the problem of the beam absorber system In addition there are sub objectives have been achieved in this thesis to study the effect elasticity ration of the main and absorber beams to study the effect of the moving mass inertia on the main beam response and finally to find the optimum design for the absorber system The objectives have been achieved by developing the damping factor formulation of dynamic vibration absorber and by using Time integration method in aided MATLAB That was in the theoretical study An experimental test has been performed by using LMS software to observe the performance of the absorber beam in suppressing the main beam vibration The numerical results showed good agreement with the literature That means the proposed method has been successfully developed The experimental results showed good agreement with the numerical results In other hand it was found from the results that the effect of the moving mass inertia on the main beam response can be reduced by increasing the layer stiffness Also it has been noted that the elasticity ratio can be improved to find the optimum design of the absorber beam system by increasing its value and decreasing the mass ratio of the main and absorber beams Finally the numerical results proved that the proposed method is more effective than the methods used in previous works because it valid for identical and non identical beams

A Flexible Beam Vibration Absorber Brian M. O'Briain, 1970 *Virtual Experiments in Mechanical Vibrations* Michael J. Brennan, Bin Tang, 2022-10-10 VIRTUAL EXPERIMENTS in MECHANICAL VIBRATIONS The first book of its kind to explain fundamental concepts in both vibrations and signal processing using MATLAB virtual experiments Students and young engineers with a strong grounding in engineering theory often lack the practical skills and knowledge required to carry out experimental work in the laboratory Fundamental and time consuming errors can be avoided with the appropriate training and a solid understanding of basic concepts in vibrations and or signal processing which are critical to testing new designs Virtual Experiments in Mechanical Vibrations Structural Dynamics and Signal Processing is designed for readers with limited knowledge of vibrations and signal

processing The intention is to help them relate vibration theory to measurements carried out in the laboratory With a hands on approach that emphasizes physics rather than mathematics this practical resource explains fundamental concepts in vibrations and signal processing It uses the concept of a virtual experiment together with MATLAB to show how the dynamic properties of vibration isolators can be determined how vibration absorbers can be designed and how they perform on distributed parameter structures Readers will find that this text Allows the concepts of experimental work to be discussed and simulated in the classroom using a physics based approach Presents computational virtual experiments using MATLAB examples to determine the dynamic behaviour of several common dynamic systems Explains the rationale of virtual experimentation and describes typical vibration testing setups Introduces the signal processing tools needed to determine the frequency response of a system from input and output data Includes access to a companion website containing MATLAB code Virtual Experiments in Mechanical Vibrations Structural Dynamics and Signal Processing is a must have resource for researchers mechanical engineers and advanced undergraduate and graduate students who are new to the subjects of vibrations signal processing and vibration testing It is also an invaluable tool for universities where the possibilities of doing experimental work are limited
