From National Fuel Gas Code - Table F-4

f. For the White-Rodgers gas valve model 36G:

1. Adjust low fire by removing the low adjustment regulator cover screw (See Figure 49).
2. To increase outlet pressure, turn the regulator adjust screw clockwise. To decrease outlet pressure, turn the regulator adjust screw counterclockwise. Adjust regulator until pressure shown on manometer matches the pressure specified in Table 11.

3. Replace and tighten the regulator cover screw securely.
4. Cycle the valve several times to verify regulator setting.
5. Adjust high fire by removing the high adjustment regulator cover screw (See Figure 49).
6. To increase outlet pressure, turn the regulator adjust screw clockwise. To decrease outlet pressure, turn the regulator adjust screw counterclockwise. The final manifold pressure setting shall be as specified in Table 11 with an input of no more than nameplate rating and no less than 90% of the nameplate rating, unless the unit is derated for high altitude.
7. Replace high adjustment regulator cover screw and tighten securely.
8. Cycle the valve several times to verify regulator setting.
- g. Turn off all electrical power to the system.
- h. Remove the manometer and flexible tubing. Remove the barbed fitting and replace the plug or tighten the pressure test screw.
- i. Turn on electrical power to the system and energize valve.
- j. Using a leak detection solution or soap suds, check for leaks at plug or pressure test screw.

NOTE:

The manifold pressure must be referenced to the burner box. The burner box pressure tap equalizes the gas valve pressure regulator. Manifold pressure is checked by installing a tee (field supplied) in the tubing, between the tee coming from the burner box tube and the gas valve, in addition to the regular gas valve pressure tap on the outlet side of the gas valve. See Figure 47.
