Report on Analysis of the 260-Day Value at Risk (VAR) of Portfolio of Shares Calvin Monroe, 2014-02-28 Scientific Essay from the year 2012 in the subject Business economics Investment and Finance grade B King s College London language English abstract For quite a long time now the main concern for investors as well as regulators of financial markets has been the risk of catastrophic market and the sufficiency of capital needed to counter such kind of risk when it occurs Many institutions have undergone losses despite their gigantic nature and good forecasting and this has been associated with inappropriate forms of pricing and poor management together with the fraudulent cases factors that have always brought the issue of managing risk and regulating these financial markets to the level of public policy as well as discussion A basic tool that has been identified as being effective in the assessment of financial risk is the Value at Risk VaR process Artzner et al 1997 The VaR has been figured out as being an amount that is lost on a given form of portfolio including a small probability in a certain fixed period of time counted in terms of days VaR however poses a major challenge during its implementation and this has more to do with the specification of the kind of probability distribution having extreme returns that is made use of during the calculation of the estimates used in the VaR analysis Mahoney 1996 McNeil Dowd 2001 As has been noted the nature of VaR estimation majorly does depend on the accurate predictions of some uncommon events or risks that are catastrophic This is attributed to the fact that VaR is a calculation made from the lowest portfolio returns For this reason any form of calculation that is employed in the estimation of VaR must be able to encompass the tail events prediction and make this its primary goal Chiang et al 2007 Engle 2002 Engle Engle Francis et al 2001 There have been statistical techniques as well as thumb rules that many researchers argue as having been very instrumental in the prediction and analysis of intra day and in most cases day to day risk These are however not appropriate for the analysis of VaR The predictions of VaR now fall under parametric predictions that encompass conditional volatilities and non parametric prediction that incorporate the unconditional volatilities Jorion 2006 Jorion 2007 What are the chances and limitations of value-at-risk (VaR) models?

The risk and return framework is generally accepted and discussed by scientists at least since Markowitz introduced his Portfolio Theory in 1952. Subsequently models were developed to evaluate investments under consideration of risk and return. Traditionally practitioners primarily focused on past earnings as a measure of the profitability of an investment without adequately considering potential risks. Therefore the development of professional risk management systems was often neglected. Thus the possibility of high losses was not appropriately incorporated in their investment strategies. The consequences of such mistreatment became evident in the mid 1990s when some of the world's largest companies faced huge losses and sometimes even insolvency. Most of these failures were a direct result of inappropriate use of financial instruments and insufficient internal control mechanisms. The most spectacular debacles even resulted in losses of more than one billion dollars for each affected institution. In case of Barings Bank a single trader ruined the 233 year old British financial institution by inappropriate investments in high risk futures in 1995. The consequent loss of 1.3 billion realized in a very short period could not be absorbed and forced the downfall of Barings. At Daiwa Bank it was also a single trader who caused a 1.1 billion deficit. In contrast the losses were accumulated over 11 years from 1984. Another well publicized bankruptcy was declared in 1994 by the Californian Orange County after losses of 1.8 billion. Such evidence of poor risk management and control shows that proper financial risk management is crucial for all kinds of institutions in order to guarantee stability and continuity. Therefore it is necessary to establish adequate risk management processes and to develop appropriate tools which quantify risk exposures of both entire institutions and single financial instruments. This risk quantification should alert management early enough to prevent exceptional losses. One of the key concepts addressing these problems of modern risk management was introduced in 1993 with the Value at Risk (VaR) models.
