Biomaterials as a kind of natural or synthetic functional materials are widely applied for pharmaceutical science because of their excellent biocompatibility and biofunctions especially playing an increasing role in controlled drug delivery. The development of biomaterials for smart drug delivery promotes advances in medicine. Various biomaterials are designed and prepared to deliver different therapeutic drugs including small molecule drugs, peptides, proteins, genes, and so forth to the lesion sites in a more precise and controlled manner, improve the specificity and bioavailability, upregulate the therapeutic effects of the diseases, and reduce the side effects to avoid the damage to normal tissues and organs. Researchers are accelerating the development of controlled drug delivery where pharmaceutical biomaterials serve as a universal platform to improve therapeutic accuracy and help us achieve an entirely precise drug temporally and spatially. However, many problems of biomaterials still need to be solved for intelligent drug delivery. For example, the stability, uniformity, and safety of biomaterials as drug carriers still need to be further confirmed. The biomaterials with unique drug loading properties should be further revealed to improve the precision of targeted and controlled drug release to enhance the drug delivery system's application efficiency and meet clinical needs. The design and development of a smart library of biomaterials remain challenging, and patient heterogeneity poses an ongoing challenge. Because of this, there are many more possibilities to look forward to in biomaterial delivery drug systems. The multidisciplinary collaborations have produced innovative strategies to treat a range of diseases.
