Why Elephants Have Big Ears Chris Lavers, 2011-04-01 Why Elephants Have Big Ears is the result of one man's lifelong quest to understand why the creatures of the earth appear and act as they do In a wry manner and personal tone Chris Lavers explores and solves some of nature's most challenging evolutionary mysteries such as why birds are small and plentiful why rivers and lakes are dominated by the few remaining large reptiles why most of the large land dwellers are mammals and many more

Why Elephants Have Big Ears Chris Lavers, 2001 Why are all the big land animals on Earth mammals Why are reptiles so small today when they were so huge in the Age of Dinosaurs Why are rivers lakes and swamps dominated by large cold blooded reptiles and not by mammals Why are there so many birds on Earth and why are they all so small In this beautifully written and utterly compelling book Lavers scours the fields of biology physiology ecology and palaeontology to find answers to these global scale questions In the process he reveals a fundamentally new view of life on Earth one that offers no room for notions of superiority and inferiority in nature If you want to understand evolution read this David Bellamy

Extinctions in the History of Life Paul D. Taylor, 2004-11-11 Extinction is the ultimate fate of all biological species over 99 percent of the species that have ever inhabited the Earth are now extinct The long fossil record of life provides scientists with crucial information about when species became extinct which species were most vulnerable to extinction and what processes may have brought about extinctions in the geological past Key aspects of extinctions in the history of life are here reviewed by six leading palaeontologists providing a source text for geology and biology undergraduates as well as more advanced scholars Topical issues such as the causes of mass extinctions and how animal and plant life has recovered from these cataclysmic events that have shaped biological evolution are dealt with This helps us to view the biodiversity crisis in a broader context and shows how large scale extinctions have had profound and long lasting effects on the Earth's biosphere

Threads from the Web of Life & The Shark and the Jellyfish Stephen Daubert, 2019-08-15 Ecology like all literary narrative has the potential for turnabout surprise lessons learned and tragedy The stories in Threads from the Web of Life and The Shark and the Jellyfish describe protagonists their competitors and the habitats that provide the setting for their interaction habitats that have become surprisingly complex with the passage of evolutionary time One niche moves across a world of flowers that reaches its earliest peak bloom in the low valleys and then peaks later among the slopes of the foothills a rolling habitat Another hop scotches across the ocean floor compelling its occupants to migrate from the fallen body of one dead whale to the next Yet

another appears in the aftermath of typhoons requiring its inhabitants to search the tropical coastline for the latest storm landfall These tales are filled with no less intrigue than other literary works but they transpire out of the sight of most readers Once known only to ecologists in *Threads from the Web of Life* and *The Shark and the Jellyfish* available for the first time in a single deluxe paperback these stories become accessible to everyone with an interest in natural history **Here Be Dragons** ,2011-06-09 Why do we find polar bears only in the Arctic and penguins only in the Antarctic Why do oceanic islands often have many types of birds but no large native mammals As Charles Darwin and Alfred Russel Wallace travelled across distant lands studying the wildlife they both noticed that the distribution of plants and animals formed striking patterns patterns that held strong clues to the past of the planet The study of the spatial distribution of living things is known as biogeography It is a field that could be said to have begun with Darwin and Wallace In this lively book Denis McCarthy tells the story of biogeography from the 19th century to its growth into a major field of interdisciplinary research in the present day It is a story that encompasses two great insightful theories that were to provide the explanations to the strange patterns of life across the world evolution and plate tectonics We find animals and plants where we do because over time the continents have moved separating and coalescing in a long slow dance because sea levels have risen cutting off one bit of land from another and fallen creating land bridges because new and barren volcanic islands have risen up from the sea and because animals and plants vary greatly in their ability to travel and separation has caused the formation of new species The story of biogeography is the story of how life has responded and has in turn altered the ever changing Earth It is a narrative that includes many fascinating tales of pygmy mammoths and elephant birds of changing landscapes of radical ideas by bold young scientists first dismissed and later with vastly growing evidence widely accepted The story is not yet done there are still questions to be answered and biogeography is a lively area of research and debate But our view of the planet has been changed profoundly by biogeography and its related fields the emerging understanding is of a deeply interconnected system in which life and physical forces interact dynamically in space and time [Arguing for Evolution](#) Sehoya H. Cotner,Randy Moore,2011-08-15 This timely encyclopedia presents an arsenal of evidence for evolution that goes beyond the typical textbook examples *Arguing for Evolution An Encyclopedia for Understanding Science* provides readers with a single source for the scientific evidence supporting evolution The book shows how scientists have tested the predictions of evolutionary theory and created an unshakeable foundation of evidence supporting its truth As such it demonstrates how evolution serves as a case study for understanding the scientific method and presents a logical model for scientific inquiry The evidence for evolution is presented historically and topically in an accessible example rich and logical format using an arsenal of examples that goes beyond the typical textbook matter The chapters are structured around a series of hypotheses that the authors put to the test amassing evidence on fossils comparative anatomy molecules and evolutionary biology in order to conclude that evolution is scientific fact Learning about this fascinating field is enhanced through see for yourself examples that include

original data and figures from key historical and contemporary papers in evolutionary biology

Threads from the Web of Life Stephen Daubert, 2006 A Selection of the Discovery Channel Book Club In sixteen stories Steve Daubert pulls the reader into the mystery and immediacy of ecological processes spanning a range from microscopic to tectonic from microscopic to cosmic forces Each tale brings the reader into the moment to witness an episode of survival in the wild first hand The material is presented on a level of intimacy and detail not usually encountered in other styles of natural history writing These creative non fiction stories provide not just a bird s eye view though that s true for the owls warblers condors and hummingbirds in the book but a wasp s eye view a mouse s a sea turtle s a squid s Sometimes the focus is as small as the detritus on the forest floor or a single beat of the wing of a gull Other stories range across evolutionary time From whales and dinosaurs to creatures invisible to the naked eye author and illustrator bring to life the dynamic interplay of living evolving creatures and the natural forces that have shaped their worlds The book includes chapter notes that document the scientific basis for each story and describe the controversies still surrounding some of them a splendid resource for families to read and share
