

## SECTION III

# TESTING AND TROUBLESHOOTING

*Fig. 1 Bringing Oil To Operating Temperature with Hydraulic Tester*

### GENERAL

Make all tests with oil at proper level and operating temperature (approximately 130° F. - 54° C.) Tester (Fig. 1) can be used to bring oil to operating temperature as follows: Connect hoses to remote valve couplings and tester ports as shown. Operate engine at rated load speed, place remote valve lever in raise position and partially restrict oil flow through tester. Observe tester temperature gauge to determine when oil is at operating temperature. If tester is not available, connect a loop line (Fig. 2) to remote valve couplings. Operate engine at rated load speed and place remote valve lever in raise position. Place a thermometer in reservoir filler tube to monitor oil temperature. If desired, an adjustable restrictor can be utilized with loop line to reduce time required to raise temperature.

### BLEEDING SYSTEM

Air trapped in system can be eliminated by installing a loop line in remote couplings (Fig. 2) or by partially

*Fig. 2 Loop Line Installed*

depressing brake pedal to hold brake valve spool(s) in a feathered position. Air can also be eliminated from system by cycling three-point hitch.

### TESTING

**CHARGE-LUBE PUMP, RESERVOIR, FILTER AND COOLER** — Oil temperature indicator light and lubrication pressure indicator light provide notification of problems with pump, filter, reservoir, cooler and related components such as lines, fittings, etc. If high temperature or low pressure is encountered, check for plugged cooler or filter, restricted reservoir screen, low oil level or pressure control valve stuck open. Check lines and fittings for obstructions. To determine charge-lube pump governor component condition, pump removal is required for visual inspection.
