Multi-Objective Optimisation Applied to Complex Model-Based Water-Related Problems Oscar Osvaldo Marquez

Calvo, 2020-02-07 The exercise of solving engineering problems that require optimisation procedures can be seriously affected by uncertain variables resulting in potential underperforming solutions Although this is a well known problem important knowledge gaps are still to be addressed For example concepts of robustness largely differ from study to study robust solutions are generally provided with limited information about their uncertainty and robust optimisation is difficult to apply as it is a computationally demanding task The proposed research aims to address the mentioned challenges and focuses on robust optimisation of multiple objectives and multiple sources of probabilistically described uncertainty This is done by the development of the Robust Optimisation and Probabilistic Analysis of Robustness algorithm ROPAR which integrates widely accepted robustness metrics into a single flexible framework In this thesis ROPAR is not only tested in benchmark functions but also in engineering problems related to the water sector in particular the design of urban drainage and water distribution systems ROPAR allows for employing practically any existing multi objective optimisation algorithm as its internal optimisation engine which enables its applicability to other problems as well Additionally ROPAR can be
