

An aerial photograph of an industrial or commercial area, featuring large blue-roofed buildings, parking lots with several vehicles, and surrounding greenery. A large, white, curved structure, likely a wind turbine blade, dominates the foreground, extending from the left side across the top of the frame. The background shows a body of water and distant hills under a clear sky.

Dymock, 2017 Application of Artificial Intelligence on Design Strategies to Optimize Urban Wind Energy Stéphanie Higgins, 2021 Maximizing urban wind energy capture constitutes a step towards self sufficient buildings Optimizing urban wind power requires knowledge of the environmental and building parameters modifying energy capture and tools for predicting urban wind behaviors This thesis main objective is to build a database to develop artificial intelligence AI

programs to evaluate different design strategies and optimize urban wind energy The database includes experimental wind tunnel velocities and turbulence intensities for terrain roughness channeling effect typical building shapes and several city configurations for several turbine locations Wind velocities and turbulence intensities measured at the street level and rooftop turbines on rectangular U shaped and L shaped buildings are further investigated with literature CFD results Through the different combinations of experimental results and literature a total of over 150 cases are added to the database A decisional flow chart is developed using the results database and served as a results summary and an aid for programming the artificial intelligence AI networks The elaborated database is implemented in an expert system and an artificial neural network The AI programs are tested with city configurations models and a real case study Ren L vesque Boulevard in downtown Montreal Comparing the testing set to the actual experimental values the data expert system predicts the modification in wind velocities with 68% 98 curacy The feedforward artificial neural network developed is slightly more accurate than the expert system showing success rates from 76% to 99% Thus AI tools and the decisional flow chart approach may be used for a preliminary assessment of the different design strategies power capture in urban environment

Office of Graduate Studies and Research,2011 How Much Can Small-Scale Wind Energy Production Contribute to Energy Supply in Cities? A Case Study of Berlin Alina Wilke,Zhiwei Shen,Matthias Ritter,2020 In light of the Paris Agreement many cities have undertaken initiatives to become climate neutral making decentralized urban energy production more relevant This paper addresses the potential of urban wind energy production with small wind turbines using Berlin as an example Based on a detailed dataset of all buildings and the hourly wind speed on a 1 km² grid the potential energy production of each building and Berlin as a whole is assessed The results show that multiple turbines on suitable buildings are necessary to cover a considerable amount of all households energy consumption Nevertheless the use of small wind turbines is currently beneficial for individual households to reduce their energy expenditures
