Handbook of Fourier Analysis & Its Applications

Robert J Marks II, 2009-01-08 Fourier analysis has many scientific applications in physics number theory combinatorics signal processing probability theory statistics option pricing cryptography acoustics oceanography optics and diffraction geometry and other areas In signal processing and related fields Fourier analysis is typically thought of as decomposing a signal into its component frequencies and their amplitudes This practical applications

based professional handbook comprehensively covers the theory and applications of Fourier Analysis spanning topics from engineering mathematics signal processing and related multidimensional transform theory and quantum physics to elementary deterministic finance and even the foundations of western music theory As a definitive text on Fourier Analysis Handbook of Fourier Analysis and Its Applications is meant to replace several less comprehensive volumes on the subject such as Processing of Multifimensional Signals by Alexandre Smirnov Modern Sampling Theory by John J Benedetto and Paulo J S G Ferreira Vector Space Projections by Henry Stark and Yongyi Yang and Fourier Analysis and Imaging by Ronald N Bracewell In addition to being primarily used as a professional handbook it includes sample problems and their solutions at the end of each section and thus serves as a textbook for advanced undergraduate students and beginning graduate students in courses such as Multidimensional Signals and Systems Signal Analysis Introduction to Shannon Sampling and Interpolation Theory Random Variables and Stochastic Processes and Signals and Linear Systems

Handbook of Blind Source Separation Pierre Comon, Christian Jutten, 2010-02-17 Edited by the people who were forerunners in creating the field together with contributions from 34 leading international experts this handbook provides the definitive reference on Blind Source Separation giving a broad and comprehensive description of all the core principles and methods numerical algorithms and major applications in the fields of telecommunications biomedical engineering and audio acoustic and speech processing Going beyond a machine learning perspective the book reflects recent results in signal processing and numerical analysis and includes topics such as optimization criteria mathematical tools the design of numerical algorithms convolutive mixtures and time frequency approaches This Handbook is an ideal reference for university researchers R algebraic identification of under determined mixtures time frequency methods Bayesian approaches blind identification under non negativity approaches semi blind methods for communications Shows the applications of the methods to key application areas such as telecommunications biomedical engineering speech acoustic audio and music processing while also giving a general method for developing applications

Two-dimensional Signal Analysis René Garello, 2013-03-01 This title sets out to show that 2 D signal analysis has its own role to play alongside signal processing and image processing Concentrating its coverage on those 2 D signals coming from physical sensors such as radars and sonars the discussion explores a 2 D spectral approach but develops the modeling of 2 D signals and proposes several data oriented analysis techniques for dealing with them Coverage is also given to potential future developments in this area

Time-frequency Analysis of Seismic Signals Yanghua Wang, 2022-10-03 A practical and insightful discussion of time frequency analysis methods and technologies Time frequency analysis of seismic signals aims to reveal the local properties of nonstationary signals The local properties such as time period frequency and spectral content vary with time and the time of a seismic signal is a proxy of geologic depth Therefore the time frequency spectrum is composed of the frequency spectra that are generated by using the classic Fourier transform at different time positions Different time frequency analysis methods are distinguished in the construction of the local kernel

prior to using the Fourier transform Based on the difference in constructing the Fourier transform kernel this book categorises time frequency analysis methods into two groups Gabor transform type methods and energy density distribution methods This book systematically presents time frequency analysis methods including technologies which have not been previously discussed in print or in which the author has been instrumental in developing In the presentation of each method the fundamental theory and mathematical concepts are summarised with an emphasis on the engineering aspects This book also provides a practical guide to geophysicists who attempt to generate geophysically meaningful time frequency spectra who attempt to process seismic data with time dependent operations for the fidelity of nonstationary signals and who attempt to exploit the time frequency space seismic attributes for quantitative characterisation of hydrocarbon reservoirs
