

ENTROPY, DISORDER

Entropy is the degree of randomness in a substance. This implies that change in entropy in ΔS , implies how more ordered and how less ordered. Molecules with smaller bond lengths have stronger forces and they move about more freely, and gases have an even larger amount of entropy. According to the thermodynamics of the molecules, subject to change in ordering in a state of highest entropy.

Entropy increases when the following reactions occur and decrease in enthalpy is observed (exothermic ΔH or negative ΔH).

HEAT OF REACTION, ENTHALPY

The equation for heat of reaction is $\Delta H = \Delta H^\circ - T\Delta S$

Here ΔH° is the standard enthalpy of reaction, ΔH represents the heat of reaction, ΔS is the change in entropy, T is temperature in Kelvin.

A negative value for ΔH means that the reaction is exothermic. This means that heat is released.

A positive value for ΔH means that the reaction is endothermic. This means that heat is absorbed.

A negative value for ΔS means that the products are more ordered than the reactants.

A positive value for ΔS means that the products are less ordered than the reactants.
