Resumo

O presente artigo relata três casos clínicos de deformidades dentofaciais tratados na Clínica de Ortodontia da FO-UERJ. A integração entre as áreas da saúde foi primordial na condução, conclusão e sucesso dos casos. O primeiro relato descreve o tratamento ortodôntico de uma menina de 10 anos com síndrome de Turner do tipo mosaico. Portadora de maloclusão de classe II, o plano de tratamento consistiu no controle de crescimento facial para o estabelecimento de uma oclusão estável em conjunto a uma terapia com hormônios para estimular o crescimento corporal. O segundo relato descreve o caso de uma jovem de 20 anos portadora de microsomia hemifacial com grande comprometimento estético e psicológico. Paciente portadora de maloclusão dentária e esquelética de classe II e grande assimetria facial foi submetida a preparo ortodôntico para cirurgia ortognática associada com enxerto de costela para reconstituição da estrutura mandibular não desenvolvida. O terceiro relato descreve o caso de uma menina de 12 anos portadora de síndrome de Esco-

bar, com grande comprometimento estético e funcional. A deformação facial incluía atresia maxilar severa, classe II esquelética com padrão de crescimento vertical e mordida aberta total. Em todos os casos o tratamento multidisciplinar permitiu melhora da função oclusal e da auto-estima das pacientes.

Parâmetros faciais e dentários de referência para indicação do tratamento ortodôntico-cirúrgico em pacientes com deformidades dentofaciais padrão II., 2006 O objetivo do presente estudo foi determinar os parâmetros morfológicos faciais e dentários que devem ser utilizados como referência pelo profissional ortodontista e cirurgião para indicação do tratamento ortodôntico cirúrgico em pacientes com deformidades dentofaciais do Padrão II Foram selecionados 40 pacientes brasileiros com crescimento finalizado 26 do gênero feminino e 14 do masculino com ângulo de convexidade facial maior que 12° e exposição gengival no sorriso igual ou menor a 3 mm Foram excluídos os indivíduos xantodermas e melanodermas ou aqueles que já se submeteram a qualquer cirurgia facial Foram obtidas fotografias extrabuciais de frente de perfil e do sorriso fotografias intrabuciais frontal e laterais direita e esquerda modelos de gesso e telerradiografias do perfil facial de todos os pacientes Toda essa documentação foi digitalizada e os arquivos enviados para 30 professores de cursos de Pós-graduação em Ortodontia Os avaliadores foram

solicitados a determinar em uma lista de fatores relacionados ao diagnóstico ortodôntico os que eles consideravam de extrema moderada ou pequena importância na indicação da cirurgia ortognática. Posteriormente deveriam avaliar os arquivos com as documentações ortodônticas para classificar a estética facial agradável, aceitável, desagradável e a melhor opção de tratamento. Tratamento ortodôntico compensatório, tratamento ortodôntico cirúrgico, nenhum tratamento para cada paciente da amostra. Foram obtidas as medidas das variáveis da análise facial numérica do perfil nas fotografias do perfil facial da sobressaliência e da sobremordida nos modelos de gesso das inclinações dos incisivos superiores e inferiores além do tipo facial nas telerradiografias do perfil. Testou-se então a associação entre cada uma das variáveis acima além da idade e do gênero e a indicação do tratamento ortodôntico cirúrgico e a partir das variáveis que apresentaram associação estabeleceu-se uma equação matemática.

Efeito do tratamento da deformidade dentofacial na função mastigatória, atividade eletromiográfica e espessura dos músculos da mastigação Luciana Vitaliano, Vio Trawitzki, 2004. Continuou e foi observada uma diminuição do predomínio mastigatório após a correção cirúrgica. Houve diferença na atividade EMG entre os lados de direita e esquerda na mastigação para os 3 grupos com variações nas 2 análises de EMG aplicadas. Durante a Mo na análise de RMS verificaram-se valores maiores no lado direito nos grupos GC e P1 com valores maiores para o lado esquerdo no grupo P2 o que não ocorreu na análise de IA de EMG. Houve um aumento na atividade EMG após a cirurgia. Os grupos P1 e P2 apresentaram valores menores de atividade EMG comparados ao GC. Nos 3 grupos verificaram-se valores maiores de espessura do músculo M durante a Mo comparada ao R e não houve diferença entre os lados. Houve um aumento na espessura do músculo M no grupo P2 por isso os valores ainda foram menores que o GC. Houve correlação entre a espessura do MD e pode-se concluir que os pacientes apresentaram melhora da função mastigatória apesar de não estar adequada em todos os pacientes. Houve um aumento da atividade EMG dos músculos T e M e da espessura do músculo M após a correção cirúrgica da deformidade dentofacial acompanhada de um tratamento interdisciplinar por isso os valores ainda foram menores que o GC.
