Uses Of Geothermal Energy In Food And Agriculture Opportunities For Developing Countries:

Uses of Geothermal Energy in Food and Agriculture Minh Van Nguyen, Sigurjón Arason, Margeir Gissurarson, Páll Gunnar Pálsson, 2015 Agriculture and agro industry are important sectors in the economies of most developing countries where they provide the main source of livelihoods for the majority of the poor. The lack of a sustainable supply of affordable energy is a major constraint to the development of these sectors in developing countries. Traditionally geothermal energy has been utilized mainly to generate electricity; however, it can be harnessed for other important uses in agriculture and agro industry. Developing countries endowed with this renewable energy source have ample potential to use it in advancing their agriculture and agro industry sectors. This book reviews the use of geothermal energy in agriculture and agro industry around the world. With a simple format and copious illustrations and models, the book is accessible to a wide range of interested readers, including those with no technical background. It shows that geothermal resources have the potential to provide long-term secure energy for the agriculture and food industry in both developed and developing countries. Constraints and challenges that should be addressed before this potential can be fully achieved are also discussed. Publisher's description

Sustainable Food Drying Techniques in Developing Countries: Prospects and Challenges Mahadi Hasan Masud, Azharul Karim, Anan Ashrabi Ananno, Asif Ahmed, 2020-05-08 This book presents a comprehensive review of renewable energy-based sustainable drying techniques for developing countries. Aspiring towards a world with zero food waste, the book has provided discussion on sustainable drying techniques in terms of energy efficiency. The socio-economic condition of each developing country is unique; therefore, it has specific technological requirements. As such, the book presents discussions on food waste scenarios around the world, the socio-economic status of developing countries, and their correlation with food. The book gives an overview of the quality aspects of drying along with the required energy and time to retain these features. Additionally, a method of selecting drying techniques for developing countries, taking the cost and safety factor into consideration, has been discussed extensively. Also, the renewable and non-renewable energy resources of low-income, lower-middle income, middle income, and high-income developing countries have been analyzed and presented. The book also highlights the available drying techniques that are currently being practiced by the consumers and industries of developing countries. The book recommends ten sustainable drying technologies for the developing countries and describes their working principle. Discussion on potential challenges for sustainable drying technology adoption is also presented. The book presents up-to-date research on sustainable drying techniques and their impact on developing countries to reduce food waste. Food waste is not only a humanitarian concern but also a threat to environmental sustainability. Currently, one-third of all produced food is being wasted when nearly 805 million people, including children, remain undernourished on a daily basis. In an effort to solve this crisis, a number of food preservation techniques are being practiced in the food supply chain. Drying is one such preservation technique that prevents microbial proliferation, slows enzymatic reaction, and preserves the physio

chemical properties of food. Although drying is an effective means of food preservation, it is also highly energy intensive. Developing countries do not have sufficient energy and financial resources to adopt conventional expensive and high energy drying techniques. As such, this is the first reference work dedicated to discussing the prospects and challenges of sustainable renewable energy based and inexpensive drying techniques for developing countries in order to reduce food waste. Sustainable food drying techniques in developing countries: Prospects and Challenges is a singular work in the field of food preservation and affordable drying technology.

Renewable energy for agri-food systems: Towards the Sustainable Development Goals and the Paris Agreement International Renewable Energy Agency, Food and Agriculture Organization of the United Nations, 2021-11-03. In 2021, the United Nations Secretary General will convene the Food Systems Summit to advance dialogue and action towards transforming the way the world produces, consumes and thinks about food, guided by the overarching vision of a fairer, more sustainable world. The Secretary General will also convene the High Level Dialogue on Energy HLDE to promote the implementation of the energy related goals and targets of the 2030 Agenda for Sustainable Development. Given the inextricable linkages between the energy and agriculture sectors, integrating the nexus perspective within the FSS and the HLDE is crucial to formulate a joint vision of actions to advance the 2030 Agenda for Sustainable Development and the Paris Agreement. In this context, IRENA and FAO have decided to jointly develop a report on the role of renewable energy used in food chain to advance energy and food security as well as climate action towards the achievement of Sustainable Development Goals and the Paris Agreement. While energy has a key enabling role in food system transformation and innovation in agriculture, its current use is unsustainable because of the high dependence on fossil fuels and frequent access to energy in developing countries. The challenge is to disconnect fossil fuel use from food system transformation without hampering food security. The use of renewable energy in food systems offers vast opportunities to address this challenge and help food systems meet their energy needs while advancing rural development while contributing to rural development and climate action.

The Water-Food-Energy Nexus I. M. Mujtaba, R. Srinivasan, N. O. Elbashir, 2017-09-11. Exponential growth of the worldwide population requires increasing amounts of water, food and energy. However, as the quantity of available fresh water and energy sources directly affecting cost of food production and transportation diminishes, technological solutions are necessary to secure sustainable supplies. In direct response to this reality, this book focuses on the water-energy-food nexus and describes in depth the challenges and processes involved in efficient water and energy production and management, wastewater treatment and impact upon food and essential commodities. The book is organized into 4 sections on water, food

energy and the future of sustainability highlighting the interplay among these topics The first section emphasizes water desalination water management and wastewater treatment The second section discusses cereal processing sustainable food security bioenergy in food production water and energy consumption in food processing and mathematical modeling for food undergoing phase changes The third section discusses fossil fuels biofuels synthetic fuels renewable energy and carbon capture Finally the book concludes with a discussion of the future of sustainability including coverage of the role of molecular thermodynamics in developing processes and products green engineering in process systems petrochemical water splitting petrochemical approaches to solar hydrogen generation design and operation strategy of energy efficient processes and the sustainability of process supply chain and enterprise
