Thermoplastic Materials Christopher C. Ibeh, 2011 **Thermoplastic Materials** Christopher C. Ibeh, 2011-04-25 This text offers a detailed presentation of thermoplastic materials that are commercially available for the plastics and polymer industries. It discusses chemical structure, property relationships, and various categories of thermoplastic resins, including general purpose, commodity, quasicommodity, engineering, and specialty. Some of the thermoplastics covered include polycarbonate, nylon, ABS, and PMMA. Using a process-oriented format, the author explores application areas of thermoplastics to elucidate the interrelation and effect of processing on the properties and performance of these materials.

Thermoplastic Materials Christopher C. Ibeh, 2011-04-25 Practical and affordable thermoplastics account for more than 90 percent of all plastic materials manufactured. That so many varieties are now available speaks to the idea that while there is no one perfect material, it is possible to find a material that fits for every application. However, selecting that right material is no small challenge. Answering the needs of manufacturers and product developers, *Thermoplastic Materials: Properties, Manufacturing Methods, and Applications* provides all the information required to confidently select the right thermoplastic for any application. Based on a course taught to engineering students, the book starts with an overview of the plastics industry, looking at the major companies involved and how their products influence society. It then discusses various topics essential to the understanding and manufacturing of thermoplastics before getting to the core of the book: more than 400 pages of consistently formatted entries organized according to 19 thermoplastics families and groupings. Each chapter covers raw materials, manufacturing methods, properties, costs, and applications. Among many topics related to thermoplastic resins, this seminal work provides micro and quasi-macro perspectives on their behavior, evaluates major manufacturing methods, discusses crystallinity and permeability, elaborates on the properties that make them useful barrier and packaging materials. Written by Christopher Ibeh, professor of plastics engineering technology and director of the Center for Nanocomposites and Multifunctional Materials at Pittsburg State University, this book goes beyond current practices to look at emerging materials, including nanocomposites, and discusses sustainability as it relates to plastics. It also includes a chapter on functionalized thermoplastics written by Andrey Beyle. *Gear Materials, Properties, and Manufacture* Joseph R. Davis, 2005 All of the critical technical aspects of gear materials technology are addressed in this new reference work. *Gear Materials: Properties and Manufacture* is intended for gear metallurgists and materials specialists, manufacturing engineers, lubrication technologists, and analysts concerned with gear failures who seek a better understanding of gear performance and gear life. This volume complements other gear texts that emphasize the design geometry and theory of gears. The coverage begins with an overview of the various types of gears used, important gear terminology, applied stresses, and strength requirements associated with gears and lubrication and wear. This is followed by in-depth treatment of metallic ferrous and nonferrous alloys and plastic gear materials. Emphasis is on the properties of carburized steels, the material of

choice for high performance power transmission gearing *Manufacturing Technologies: Materials, Operation and Applications* Tibor Krenický,Štefánia Olejárová,2017-09-22 Special topic volume with invited peer reviewed papers only
