

The Statistics of Inheritance

How can statistics help predict the traits of offspring?

Why?

The randomization of alleles from the parents' genetic material is essential to the survival and evolution of a species. If the combinations of alleles that make up the genetic material in a zygote are truly random, the laws of statistics can be used to predict what traits the offspring will have. This activity starts with a review of Punnett squares, which is one way to make predictions about simple allele combinations. Statistics will then be used to make mathematical predictions about the genotypes of offspring.

Model 1 – Punnett Squares

1. Consider the beetle species in Model 1.
 - a. How many phenotypes for exoskeleton color are exhibited in the population?

There are 2 phenotypes, black and white, for exoskeleton color exhibited in the population.

- b. How many genotypes for exoskeleton color are exhibited in the population?

There are 3 genotypes, BB, Bb, bb, for exoskeleton exhibited in the population.

2. According to Model 1, which allele, B or b, is the dominant exoskeleton color allele? Justify your answer with specific evidence from Model 1.

According to Model 1, the allele B is the dominant exoskeleton color allele as it is denoted with a capital letters. And, the Punnett Squares show how it dominated the outcome of the population when there is a dominant allele B.

The Statistics Of Inheritance:

The Statistics of Gene Mapping David Siegmund, Benjamin Yakir, 2007-05-27 This book details the statistical concepts used in gene mapping first in the experimental context of crosses of inbred lines and then in outbred populations primarily humans It presents elementary principles of probability and statistics which are implemented by computational tools based on the R programming language to simulate genetic experiments and evaluate statistical analyses Each chapter contains exercises both theoretical and computational some routine and others that are more challenging The R programming language is developed in the text

Developments in Statistics Paruchuri R. Krishnaiah, 2014-06-28 Developments in Statistics Volume 4 reviews developments in the theory and applications of statistics covering topics such as time series identifiability and model selection and missing data The application of structured exploratory data analysis to human genetics specifically the mode of inheritance is also considered Comprised of four chapters this volume begins with an introduction to spectrum parameter estimation in time series analysis restricting the discussion to the simplest univariate that is scalar real valued time series X_t An accurate formulation of the general problem is presented The accuracy of different consistent estimates obtained for large but fixed values of T maximum likelihood estimates Whittle's estimates and simplified asymptotically efficient estimates is also compared The next chapter deals with identifiability and modeling in econometrics focusing on the theoretical framework relating realization theory identification and parametrization The realization theory is illustrated on various levels of generality by means of examples related to econometrics along with some advanced applications of system theory The book also examines inference on parameters of multivariate normal populations when some data are missing before concluding with an evaluation of structured exploratory data as applied to the study of the mode of inheritance This monograph will be of interest to students and practitioners of statistics

Hierarchy in Natural and Social Sciences Denise Pumain, 2006-02-09 Hierarchy is a form of organisation of complex systems that rely on or produce a strong differentiation in capacity power and size between the parts of the system It is frequently observed within the natural living world as well as in social institutions According to the authors hierarchy results from random processes follows an intentional design or is the result of the organisation which ensures an optimal circulation of energy for information This book reviews ancient and modern representations and explanations of hierarchies and compares their relevance in a variety of fields such as language societies cities and living species It throws light on concepts and models such as scaling laws fractals and self organisation that are fundamental in the dynamics and morphology of complex systems At a time when networks are celebrated for their efficiency flexibility and better social
