highly structured tissues to individual insects working to create sophisticated societies What these diverse systems hold in common is the proximate means by which they acquire order and structure In self organizing systems pattern at the global level emerges solely from interactions among lower level components Remarkably even very complex structures result from the iteration of surprisingly simple behaviors performed by individuals relying on only local information This striking conclusion suggests important lines of inquiry To what degree is environmental rather than individual complexity responsible for group complexity To what extent have widely differing organisms adopted similar convergent strategies of pattern formation How specifically has natural selection determined the rules governing interactions within biological systems Broad in scope thorough yet accessible this book is a self contained introduction to self organization and complexity in biology a field of study at the forefront of life sciences research
