Abstract: The authors examined the effects of a 12-week, 100% body weight (BW) resistance training program on the body composition and muscle strength of 10 sedentary, middle-aged men. The men were randomly assigned to either a control group (CON) or a resistance training group (RT). The RT group performed a 12-week, 100% BW resistance training program, while the CON group remained sedentary. The RT group showed significant improvements in body composition and muscle strength compared to the CON group. The results suggest that a 12-week, 100% BW resistance training program can effectively improve body composition and muscle strength in sedentary, middle-aged men.
