The work details the required components in a virtual power plant including smartness of power system instrument and information and communication technologies (ICTs), measurement units and distributed energy sources. Contributors assess the proposed benefits of virtual power plant in solving problems of distributed energy sources in integrating the small distributed and intermittent output of these units. In addition, they investigate the likely technical challenges regarding control and interaction with other entities. Finally, the work considers the role of VPPs in electricity markets, showing how distributed energy resources and demand response providers can integrate their resources through virtual power plant concepts to effectively participate in electricity markets to solve the issues of small capacity and intermittency. The work is suitable for experienced engineers, researchers, managers and policymakers interested in using VPPs in future smart grids. Explores key enabling technologies and infrastructures for virtual power plants in future smart energy systems. Reviews technical challenges and introduces solutions to the operation and control of VPPs, particularly focusing on control and interaction with other power system entities. Introduces the key integrating role of VPPs in enabling DER powered participative electricity markets. **Engineering Guide to Planning and Design of Virtual Power Plant** Feng Yao, 2025-11-01

This book is basically for the construction of virtual power plant. According to the actual needs of the construction of virtual power plant project, the overall structure of virtual power plant and the selection and configuration of electric energy resources are optimized from the user's demand and the internal and external conditions of the construction. The construction of virtual power plant is based on the digitalization and virtualization of the traditional power business process, and it is a multidisciplinary application of comprehensive technology. From the perspective of power grid operation management and power trading market, virtual power plants built in accordance with unified norms and standards and meet the architecture and function requirements include distributed generation device, energy storage device, and controllable load. Three types of facilities at least can achieve power generation prediction, load prediction, power generation, and electricity time sharing planning, development, controllable load management, the control and management of energy storage device, coordinated optimization of distributed generation condition monitoring and communication data acquisition and analysis, and other new functions.
