**Cell Signalling** John T. Hancock, 2017 Signaling within and between cells is one of the most important aspects of modern biochemistry and cell biology An understanding of signalling pathways is vital to a wide range of biologists from those who are investigating the causes of cancer to those who are concerned about the impact of environmental pollutants on the ecosystem The way cells adapt to changing environments and the way cell dysfunction causes disease is underpinned by cell signalling events Cell Signalling presents a carefully structured and highly accessible introduction to this intricate and rapidly growing field Starting with an overview of cell signalling and highlighting its importance in many biological systems the book goes on to explore the key components of extracellular and intracellular signalling mechanisms before examining how these components come together to create signalling pathways A focus on common components and concepts rather than mechanistic detail allows the reader to gain a thorough understanding of the principles that underpin cell signalling Online Resource Centre The Online Resource Centre to accompany Cell Signalling features For students Links to useful websites For registered adopters of the text Journal Clubs suggested research papers and discussion questions linked to topics featured in the book Figures from the book in electronic format for use in lectures

*New mechanisms and therapeutics in neurodevelopmental disorders* Daniela Tropea, Neurodevelopmental disorders NDDs are severe heritable conditions characterized by impaired brain development and disability in cognition social interaction and behavior Genetic predisposition appears to interact with environmental factors to produce the onset of the disease In the last decade genomic analysis on NDDs advanced the knowledge of the genetic causes of these disorders most of the genes identified were not predicted from known biology and almost all of them engage in neurodevelopmental processes However the same studies revealed an unexpected outcome regarding the molecular etiology many of the same susceptibility genes as well as molecular pathways are emerging across hitherto unrelated disorders such as autism and schizophrenia challenging how we conceptualize these conditions These new discoveries call for the establishment of additional criteria for the classification of the genes and related phenotypes Beyond the classical distinction according to diagnostic criteria new parameters should be

taken into account the genetics the neurobiology of the gene products and the molecular mechanisms that they control Our broad understanding of NDDs requires a combination of approaches including human studies animal models and theoretical computation Indeed progress in technology and the generation of accurate models are advancing the field and the research is rapidly growing This Research Topic presents recent advances in neurodevelopmental disorders from genes to systems in single conditions and across different phenotypes and report the newest treatments in use Recognized experts in the field discuss recent findings in molecular studies in vivo imaging neuropsychology neuropharmacology and computational neuroscience This multidisciplinary approach enriches our understanding of the mechanisms involved in the onset and progression of NDDs with the perspective of revealing the biological signs of the disorders and identifying new therapeutics
