Topological Methods in Euclidean Spaces Gregory L. Naber, 2012-08-29 Extensive development of such topics as elementary combinatorial techniques Sperner s Lemma the Brouwer Fixed Point Theorem and the Stone Weierstrass Theorem New section of solutions to selected problems Topological Methods in Algebraic Transformation Groups Kraft,2012-12-06 In recent years there has been increasing interest and activity in the area of group actions on affine and projective algebraic varieties Tech niques from various branches of mathematics have been important for this study especially those coming from the well developed theory of smooth compact transformation groups It was timely to have an interdisciplinary meeting on these topics We organized the conference Topological Methods in Alg braic Transformation Groups which was held at Rutgers University 4 8 April 1988 Our aim was to facilitate an exchange of ideas and techniques among mathematicians studying compact smooth transformation groups alge braic transformation groups and related issues in algebraic and analytic geometry. The meeting was well attended and these Proceedings offer a larger audience the opportunity to benefit from the excellent survey and specialized talks presented The main topics concerned various as pects of group actions algebraic quotients homogeneous spaces and their compactifications. The meeting was made possible by support from Rutgers University and the National Science Foundation We express our deep appreciation for this support We also thank Annette Neuen for her assistance with the technical preparation of these Proceedings The Geometry of Minkowski Spacetime Gregory L. Naber, 2012-02-02 This book offers a presentation of the special theory of relativity that is mathematically rigorous and yet spells out in considerable detail the physical significance of the mathematics It treats in addition to the usual menu of topics one is accustomed to finding in introductions to special relativity a wide variety of results of more contemporary origin These include Zeeman's characterization of the causal automorphisms of Minkowski spacetime the Penrose theorem on the apparent shape of a relativistically moving sphere a detailed introduction to the theory of spinors a Petrov type classification of electromagnetic fields in both tensor and spinor form a topology for Minkowski spacetime whose homeomorphism group is essentially the Lorentz group and a careful discussion of Dirac s famous Scissors Problem and its relation to the notion of a two valued representation of the Lorentz group This second edition includes a new chapter on the de Sitter universe which is intended to serve two purposes The first is to provide a gentle prologue to the steps one must take to move beyond special relativity and adapt to the presence of gravitational fields that cannot be considered negligible The second is to understand some of the basic features of a model of the empty universe that differs markedly from Minkowski spacetime but may be recommended by recent astronomical observations suggesting that the expansion of our own universe is accelerating rather than slowing down The treatment presumes only a knowledge of linear algebra in the first three chapters a bit of real analysis in the fourth and in two appendices some elementary point set topology. The first edition of the book received the 1993 CHOICE award for Outstanding Academic Title Reviews of first edition a valuable

contribution to the pedagogical literature which will be enjoyed by all who delight in precise mathematics and physics American Mathematical Society 1993 Where many physics texts explain physical phenomena by means of mathematical models here a rigorous and detailed mathematical development is accompanied by precise physical interpretations CHOICE 1993 his talent in choosing the most significant results and ordering them within the book can t be denied. The reading of the book is really a pleasure Dutch Mathematical Society 1993 **Topological Methods in Galois Representation Theory** Victor P. Snaith, 2013-12-03 This advanced monograph on Galois representation theory by a renowned algebraist covers abelian and nonabelian cohomology of groups characteristic classes of forms and algebras explicit Brauer induction theory more 1989 edition Functional Analysis, Sobolev Spaces and Partial Differential Equations Haim Brezis, 2010-11-10 This textbook is a completely revised updated and expanded English edition of the important Analyse fonctionnelle 1983 In addition it contains a wealth of problems and exercises with solutions to guide the reader Uniquely this book presents in a coherent concise and unified way the main results from functional analysis together with the main results from the theory of partial differential equations PDEs Although there are many books on functional analysis and many on PDEs this is the first to cover both of these closely connected topics Since the French book was first published it has been translated into Spanish Italian Japanese Korean Romanian Greek and Chinese The English edition makes a welcome addition to this list Mechanics Gregory L. Naber, 2021-09-20 This work covers quantum mechanics by answering questions such as where did the Planck constant and Heisenberg algebra come from what motivated Feynman to introduce his path integral and why does one distinguish two types of particles the bosons and fermions The author addresses all these topics with utter mathematical rigor The high number of instructive Appendices and numerous Remark sections supply the necessary background knowledge Mathematics Without Boundaries Panos M. Pardalos, Themistocles M. Rassias, 2014-09-16 This volume consists of chapters written by eminent scientists and engineers from the international community and present significant advances in several theories methods and applications of an interdisciplinary research These contributions focus on both old and recent developments of Global Optimization Theory Convex Analysis Calculus of Variations Discrete Mathematics and Geometry as well as several applications to a large variety of concrete problems including applications of computers to the study of smoothness and analyticity of functions applications to epidemiological diffusion networks mathematical models of elastic and piezoelectric fields optimal algorithms stability of neutral type vector functional differential equations sampling and rational interpolation for non band limited signals recurrent neural network for convex optimization problems and experimental design The book also contains some review works which could prove particularly useful for a broader audience of readers in Mathematical and Engineering subjects and especially to graduate students who search for the latest information Analysis for Applied Mathematics Ward Cheney, 2013-04-17 This book evolved from a course at our university for beginning graduate stu dents in mathematics particularly students who intended to specialize in applied mathematics

The content of the course made it attractive to other math ematics students and to graduate students from other disciplines such as en gineering physics and computer science Since the course was designed for two semesters duration many topics could be included and dealt with in de tail Chapters 1 through 6 reflect roughly the actual nature of the course as it was taught over a number of years The content of the course was dictated by a syllabus governing our preliminary Ph D examinations in the subject of ap plied mathematics That syllabus in turn expressed a consensus of the faculty members involved in the applied mathematics program within our department. The text in its present manifestation is my interpretation of that syllabus my colleagues are blameless for whatever flaws are present and for any inadvertent deviations from the syllabus The book contains two additional chapters having important material not included in the course Chapter 8 on measure and integration is for the ben efit of readers who want a concise presentation of that subject and Chapter 7 contains some topics closely allied but peripheral to the principal thrust of the course This arrangement of the material deserves some explanation Optimization in Science and Engineering Themistocles M. Rassias, Christodoulos A. Floudas, Sergiy Butenko, 2014-05-29 Optimization in Science and Engineering is dedicated in honor of the 60th birthday of Distinguished Professor Panos M Pardalos Pardalos s past and ongoing work has made a significant impact on several theoretical and applied areas in modern optimization As tribute to the diversity of Dr Pardalos s work in Optimization this book comprises a collection of contributions from experts in various fields of this rich and diverse area of science Topics highlight recent developments and include Deterministic global optimization Variational inequalities and equilibrium problems Approximation and complexity in numerical optimization Non smooth optimization Statistical models and data mining Applications of optimization in medicine energy systems and complex network analysis This volume will be of great interest to graduate students researchers and practitioners in the fields of optimization and engineering Spacetime and Singularities Gregory L. Naber, 1988 An elementary introduction to the geometrical methods and notions used in special and general relativity Emphasizes the ideas concerned with structure of space time that play a role in Penrose Hawking singularity theorems
