Response in Health and Disease William C. Gause,David Artis,2015-12-08 The type 2 immune response that develops during infectious disease has undergone major paradigm shifts in the last several years as new cell types and pathways have been identified It is now clear that the type 2 immune response characterized by elevations in specific cytokines including IL 4 IL 5 and IL 13 is associated with helminth infections in both humans and mice This response is complex and includes effector functions that mediate resistance contributing to expulsion and in some cases destruction of the parasite But just as importantly the type 2 immune response can also mediate tolerance mechanisms which can mitigate tissue injury as these large multicellular parasites transit through vital organs The tolerance mechanisms include both tissue repair and immune regulatory effects These latter aspects of the helminth induced type 2 immune response are increasingly recognized as a potential resource that can be mined for the development of novel immunotherapies that may enhance wound healing control of autoimmune and inflammatory diseases and regulation of metabolic homeostasis In this book leading researchers in this exciting and dynamic field discuss the latest findings and emerging concepts providing an intellectual framework that can be

used as a basis for new discoveries and potentially new treatments for diseases associated with inflammation
