

Hearing voices: A spectrum of experience

It is increasingly recognised that voice-hearing events are often and often a continuum or spectrum that includes ordinary verbal thinking, day-dreaming and intrusive thoughts. We all have the capacity for 'hearing voices', it's just that some of us are more likely than others to have more intense voices, or to hear them more often.

Did you know?

Only **1%** of people have frequent voice-hearing experiences and no mental health problems.

A comparable 1% have a diagnosis of schizophrenia. Around 20% of this group will hear voices.

What is the difference between voice-hearing and my own inner voice?

Little research of our own voice which affects nearly all of us. Most people report that hearing a voice is the experience of an external source that like it comes from the self.

The content and thoughts of the voice or voices is experienced as coming from outside or outside the self. Some people experience voices that sound as if they are coming from the external environment. But many voices are experienced as internal or they seem to be our own inner voice.

What is the experience of voice-hearing in people with a diagnosis of schizophrenia or psychosis?	What is the experience of voice-hearing in people with no diagnosis?
Can the voices or voices be heard?	Can the voices or voices be heard?
Can they be heard?	Can they be heard?
Can they be heard?	Can they be heard?
Can they be heard?	Can they be heard?
Can they be heard?	Can they be heard?
Can they be heard?	Can they be heard?
Can they be heard?	Can they be heard?
Can they be heard?	Can they be heard?
Can they be heard?	Can they be heard?

Voices in people with no mental health care are also more likely to be positive and helpful than those experienced by people with psychosis. They tend to provide support and guidance and often have an important spiritual aspect.

An Integrated Approach to Home Security and Safety Systems Sonali Goyal, Neera Batra, N. K. Batra, 2021-10-14 This book provides an integrated solution for security and safety in the home covering both assistance in health monitoring and safety from strangers intruders who want to enter the home with harmful intentions It defines a system whereby recognition of a person stranger at the door is done using three modules Face Recognition Voice Recognition and Similarity Index These three modules are taken together to provide a percentage likelihood that the individual is in the known or unknown category The system can also continuously monitor the health parameters of a vulnerable person living alone at home and aid them in calling for help in an emergency The authors have analyzed a number of existing biometric techniques to provide security for an individual living alone at home These biometric techniques have been tested using MATLAB image processing and signal processing toolboxes and results have been calculated on the basis of recognition rate A major contribution in providing security is a hybrid algorithm proposed by the author named PICA which combines features of both PCA Principle Component Analysis and ICA Independent Component Analysis algorithms This hybrid approach gives better performance recognition than either system alone The second proposed hybrid algorithm for voice recognition is named as a MFRASTA algorithm by combining features of MFCC Mel Frequency Cepstral Coefficient and RASTA PLP RelAtive SpecTrA Perceptual Linear Prediction algorithm After performing experiments results are collected on the basis of recognition rate The authors have also proposed a third technique named as a Similarity Index to provide trust based security for an individual This technique is text independent in which a person is recognized by pronunciation frequency tone pitch etc irrespective of the content spoken by the person By combining these three techniques a high recognition rate is provided to the person at the door and high security to the individual living independently at home In the final contribution the authors have proposed a fingertip based application for health monitoring by using the concept of sensors This application is developed using iPhone 6 s camera When a person puts their fingertip on a camera lens with the help of brightness of the skin the person s heartbeat will be monitored This is possible even with a low quality camera In case of any emergency text messages will be sent to the family members of the individual living alone by using 3G Dongle and MATLAB tool Results show that the proposed work outperforms all the existing techniques used in face recognition voice recognition and health monitoring alone
