The seventh edition of this classic text outlines the fundamental physical principles of thermal radiation as well as analytical and numerical techniques for quantifying radiative transfer between surfaces and within participating media. The textbook includes newly expanded sections on surface properties, electromagnetic theory, scattering and absorption of particles, and near field radiative transfer, and emphasizes the broader connections to thermodynamic principles. Sections on inverse analysis and Monte Carlo methods have been enhanced and updated to reflect current research developments, along with new material on manufacturing, renewable energy, climate change, building energy efficiency, and biomedical applications.

Features:

- Offers full treatment of radiative transfer and radiation exchange in enclosures.
- Covers properties of surfaces and gaseous media and radiative transfer equation development and solutions.
- Includes expanded coverage of inverse methods, electromagnetic theory, Monte Carlo methods, and scattering and absorption by particles.
- Features expanded coverage of near field radiative transfer theory and applications.
- Discusses electromagnetic wave theory and how it is applied to thermal radiation transfer.

This textbook is ideal for Professors and students involved in first year or advanced graduate courses/modules in Radiative Heat Transfer in engineering programs. In addition, professional engineers, scientists, and researchers working in heat transfer, energy engineering, aerospace, and nuclear technology will find this an invaluable professional resource.

Over 350 surface configuration factors are available online, many with online calculation capability. Online appendices provide information on related areas such as combustion radiation in porous media, numerical methods, and biographies of important figures in the history of the field.

A Solutions Manual is available for instructors adopting the text.

Thermal Radiation Heat Transfer, Fourth Edition Robert Siegel, 2001-12-07

This extensively revised 4th edition provides an up-to-date comprehensive single source of information on the important subjects in engineering radiative heat transfer. It presents the subject in a progressive manner that is excellent for classroom use or self study, and also provides an annotated reference to literature and research in the field. The foundations and methods for treating radiative heat transfer are developed in detail, and the methods are demonstrated and clarified by solving example problems. The examples are especially helpful for self study. The treatment of spectral band properties of gases has been made current, and the methods are described in detail and illustrated with examples. The combination of radiation with conduction and/or convection has been given more emphasis and has been merged with results for radiation alone that serve as a limiting case. This increases practicality for energy transfer in translucent solids and fluids. A comprehensive catalog of configuration factors on the CD that is included with each book.

provides over 290 factors in algebraic or graphical form Homework problems with answers are given in each chapter and a detailed and carefully worked solution manual is available for instructors
