MUJUMDAR,2010-05 Thermal design in electronics cooling is to achieve effective heat removal to increase reliability and life of the components and systems This book focuses on cooling of a Flip Chip FC package without the use of phase change materials PCM A numerical thermal model was developed and validated CFD Simulation is performed for PCM and non PCM based material studies Relevant thermal performance data were obtained to show the effects of thermal interface material lid heat sink and process variables Excellent agreement found between the numerical and the measured data A novel PCM based passive thermal control of electronic devices was investigated experimentally A tall enclosure with uniform discrete heat sources applied on sides for PCM melting and another with a PCM filled heat sink setup developed and tested PCM

based cooling technique is attractive thermal concept for transient applications Effects of various parameters on melting freezing times were studied Flow visualization experiments were also made to determine the PCM melting rates Finally a 2D numerical study was conducted to compare simulation results with experimental data

Thermal Management of Electronic Systems C.J. Hoogendoorn, R.A.W.M. Henkes, C.J.M. Lasance, 2012-12-06 The Eurotherm Committee has chosen Thermal Management of Electronic Systems as the subject of its 29th Seminar at Delft University of Technology the Netherlands 14-16 June 1993 This volume constitutes the proceedings of the Seminar Thermal Management is but one of the several critical topics in the design of electronic systems However as a result of the combined effects of increasing heat fluxes miniaturisation and the striving for zero defects preferably in less time and at a lower cost than before thermal management has become an increasingly tough challenge Therefore it is being increasingly recognised that cooling requirements could eventually hamper the technical progress in miniaturisation It might be argued that we are on the verge of a revolution in thermal management techniques Previously a packaging engineer had no way of predicting the temperatures of critical electronic parts with the required accuracy He or she had to rely on full scale experiments doubtful design rules or worst case estimates This situation is going to be changed in the foreseeable future User friendly software tools the acquisition and integrity of input and output data the badly needed training measures the introduction into a concurrent engineering environment all these items will exert a heavy toll on the flexibility of the electronics industries Fortunately this situation is being realised at the appropriate management levels and the interest in this seminar and the pre conference tutorials testifies to this assertion

Thermal Management of 3-D Stacked Chips Using Thermoelectric and Microfluidic Devices Matthew J. Redmond, 2013 This thesis employs computational and experimental methods to explore hotspot cooling and high heat flux removal from a 3 D stacked chip using thermoelectric and microfluidic devices Stacked chips are expected to improve microelectronics performance but present severe thermal management challenges The thesis provides an assessment of both thermoelectric and microfluidic technologies and provides guidance for their implementation in the 3 D stacked chips A detailed 3 D thermal model of a stacked electronic package with two dies and four ultrathin integrated TECs is developed to investigate the efficacy of TECs in hotspot cooling for 3 D technology The numerical analysis suggests that TECs can be used for on demand cooling of hotspots in 3 D stacked chip architecture A strong vertical coupling is observed between the top and bottom TECs and it is found that the bottom TECs can detrimentally heat the top hotspots As a result TECs need to be carefully placed inside the package to avoid such undesired heating Thermal contact resistances between dies inside the TEC module and between the TEC and heat spreader are shown to significantly affect TEC performance TECs are most effective for cooling localized hotspots but microchannels are advantageous for cooling large background heat fluxes In the present work the results of heat transfer and pressure drop experiments in the microchannels with water as the working fluid are presented and compared to the previous microchannel experiments and CFD simulations Heat removal

rates of greater than 100 W cm^2 are demonstrated with these microchannels with a pressure drop of 75 kPa or less. A novel empirical correlation modeling method is proposed which uses finite element modeling to model conduction in the channel walls and substrate coupled with an empirical correlation to determine the convection coefficient. This empirical correlation modeling method is compared to resistor network and CFD modeling. The proposed modeling method produced more accurate results than resistor network modeling while solving 60% faster than a conjugate heat transfer model using CFD. The results of this work demonstrate that microchannels have the ability to remove high heat fluxes from microelectronic packages using water as a working fluid. Additionally, TECs can locally cool hotspots but must be carefully placed to avoid undesired heating. Future work should focus on overcoming practical challenges including fabrication cost and reliability which are preventing these technologies from being fully leveraged.
