

Science Study Guide – Chapter 12

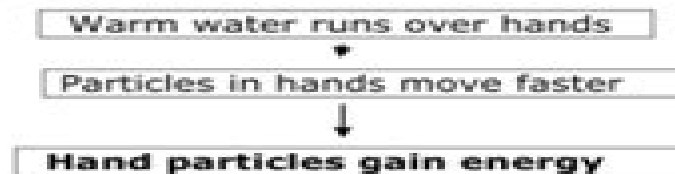

Energy

Heat is the flow of **thermal energy**.

A campfire has the fastest moving particles.

In order for conduction to occur, two objects must be **touching**.

Study the diagram below:

A glass baking dish will crack if moved from a very hot oven directly into the freezer. This is because **heat causes matter to expand, and cold causes matter to contract**. When a very hot object like glass is cooled off too quickly, it contracts fast and cracks.

Humans produce sound when their vocal chords **vibrate**.

The distance from the top of one sound wave to the top of the next sound wave is called a **wavelength**.

The loudness or softness of sound is called **volume**.

Sonar measures underwater distances by using **echoes**.

Do you think that sound would travel faster through wood or water? **Sound would travel faster through wood. Sound is created when particles bump into each other. Since particles in a solid are closer together than water particles, sound travels faster through wood.**

The following statement is NOT true about white light: **it contains only yellow and blue.**

Sunburn is caused by **ultraviolet light**.
