Randers,2012-06-13 With clarity conscience and courage global systems pioneer Jorgen Randers and his distinguished contributors map the forces that will shape the next four decades Forty years ago The Limits to Growth study addressed the grand question of how humans would adapt to the physical limitations of planet Earth It predicted that during the first half of the 21st century the ongoing growth in the human ecological footprint would stop either through catastrophic overshoot and collapse or through well managed peak and decline So where are we now And what does our future look like In the book 2052 Jorgen Randers one of the coauthors of Limits to Growth issues a progress report and makes a forecast for the next forty years To do this he asked dozens of experts to weigh in with their best predictions on how our economies energy supplies natural resources climate food fisheries militaries political divisions cities psyches and more will take shape in the coming decades He then synthesized those scenarios into a global forecast of life as we will most likely know it in the years ahead The good news we will see impressive advances in resource efficiency and an increasing focus on human well being rather than on per capita income growth But this change might not come as we expect Future growth in population and GDP for instance will be constrained in surprising ways by rapid fertility decline as result of increased urbanization productivity decline as a result of social unrest and continuing poverty among the poorest 2 billion world citizens Runaway global warming too is likely So how do we prepare for the years ahead With heart fact and wisdom Randers guides us along a realistic path into the future and discusses what readers can do to ensure a better life for themselves and their children during the increasing turmoil of the next forty years

Creating Regenerative Cities Herbert Girardet,2014-09-19 Large modern cities have effectively declared their independence from nature But while they take up only three percent of the world s land surface their ecological footprints actually cover the entire globe Humanity is building an urban future yet urban resource use is threatening the future of humanity and the natural world To meet the aspirations of city people in both developing and developed countries bold new initiatives are needed Modern cities are an astonishing human achievement As centres of

innovation they are humanity's cultural playgrounds. Their communication and transport systems have developed a global reach. They are attractive to investors because they can offer a vast variety of services at comparatively low per capita costs. But are they viable as ecological systems? The planning of new cities as well as the retrofit of existing cities needs to undergo a profound paradigm shift. Mere sustainable development is not enough. To be compatible with natural systems, cities need to move away from linear systems of resource use and learn to operate as closed loop circular systems. To ensure their long term future, they need to develop an environmentally enhancing restorative relationship between themselves and the natural systems on which they still depend. *Creating Regenerative Cities* is a concise solution oriented manual for creating regenerative urbanisation. A wide range of technical management and policy solutions already exist but implementation has been too slow and too little in large part because the kinds of holistic approaches needed are still unfamiliar to fragmented and process driven urban policy making and governance. Herbert Girardet's 30 years experience as an ecologist, thinker, film maker and consultant working around the world has created this unique combination of tried and tested best practices and policies which outlines the fundamental shifts needed in the way we think about our cities. *An Introduction to Sustainable Resource Use* Callum Hill, 2012-08-06. This book explores the challenges our society faces in making the transition to renewable resource use in a way that is truly sustainable, environmentally, economically and socially. After exploring the physical limits the laws of thermodynamics impose on resource exploitation, the book outlines options for managing resources within these limits. It then moves on to look at the resources themselves from fossil fuels through minerals to renewable resources such as timber and the salient question of how the relentless increase in consumption is putting untenable strain on resource use. Case studies investigate what is being done across a range of sectors and what is and isn't working. The second half of the book turns to solutions from the promise of industrial ecology to a new economy based on renewable resources such as biobased materials from agricultural crops and forests. Suitable for under and postgraduate courses on environmental limits and resource use and continuing professional development particularly resource management materials, industrial ecology, energy, resource economics and engineering. *Management of Natural Resources, Sustainable Development and Ecological Hazards* C. A. Brebbia, Enzo Tiezzi, M. E. Conti, 2006-11-09. The state of our planet continues to deteriorate at an alarming rate. We have arrived at a situation where we need to determine urgent solutions before we reach a point of irreversible deterioration. Much has been written in different contexts about reaching sustainability but the concept itself needs to be defined in the framework of all different disciplines in order to arrive at optimal solutions. Hence this book is essentially trans disciplinary in order to find appropriate sustainable solutions involving collaboration across a wide range of disciplines. Publishing papers from the First International Conference on Management of Natural Resources, Sustainable Development and Ecological Hazards, the book features articles encompassing topic areas such as Water Resources, Air, Soil, Ecology, Health, Risk, Energy, Planning and Development, Political and Social Issues, The Re Encounter, New Technologies.
