The Symbol Without Meaning E Singles:

Single-Ion Solvation Philippe Hunenberger, Maria Reif, 2015-10-20 Ions are ubiquitous in chemical technological ecological and biological processes Characterizing their role in these processes in the first place requires the evaluation of the thermodynamic parameters associated with the solvation of a given ion However due to the constraint of electroneutrality the involvement of surface effects and the ambiguous connection between microscopic and macroscopic descriptions the determination of single ion solvation properties via both experimental and theoretical approaches has turned out to be a very difficult and highly controversial problem This unique book provides an up to date compact and consistent account of the research field of single ion solvation thermodynamics that has over one hundred years of history and still remains largely unsolved By reviewing the various approaches employed to date establishing the relevant connections between single ion thermodynamics and electrochemistry resolving conceptual ambiguities and giving an exhaustive data compilation in the context of alkali and halide hydration this book provides a consistent synthesis in depth understanding and clarification of a large and sometimes very confusing research field The book is primarily aimed at researchers professors postgraduates graduates and industrial researchers concerned with processes involving ionic solvation properties these are ubiquitous eg in physical organic analytical chemistry electrochemistry biochemistry pharmacology geology and ecology Because of the concept definitions and data compilations it contains it is also a useful reference book to have in a university library Finally it may be of general interest to anyone wanting to learn more about ions and solvation Key features discusses both experimental and theoretical approaches and establishes the connection between them provides both an account of the past research covering over one hundred years and a discussion of current directions in particular on the theoretical side involves a comprehensive reference list of over 2000 citations employs a very consistent notation including table of symbols and unambiguous definitions of all introduced quantities provides a discussion and clarification of ambiguous concepts ie concepts that have not been defined clearly or have been defined differently by different authors leading to confusion in past literature encompasses an exhaustive data compilation in the restricted context of alkali and halide hydration along with recommended values after critical analysis of this literature data is illustrated by a number of synoptic colour figures that will help the reader to grasp the connections between different concepts in one single picture

Theory Of Single And Multiple Interfaces: The Method Of Surface Green Function Matching F Garcia-moliner, Victor R Velasco, 1992-06-08

Based on a scattering theoretic approach which effectively constitutes an extension of the Dyson or Lippman Schwinger theories Green functions constitute the backbone of a matching analysis This analysis is applied to a wide range of models materials and physical problems from electronic structure of semiconductor superlattices or phonons in metal superlattices to surface Brillouin scattering piezoelectric surface waves or interface waves in viscoelastic fluids

Function Integral Equation Methods in Nano-Optics Thomas M. Søndergaard, 2019-01-30 This book gives a comprehensive introduction to Green's function integral equation methods GFIEs for scattering problems in the field of nano optics First a brief review is given of the most important theoretical foundations from electromagnetics optics and scattering theory including theory of waveguides Fresnel reflection and scattering extinction and absorption cross sections This is followed by a presentation of different types of GFIEs of increasing complexity for one two and three dimensional scattering problems In GFIEs the electromagnetic field at any position is directly related to the field at either the inside or the surface of a scattering object placed in a reference structure The properties of the reference structure and radiating or periodic boundary conditions are automatically taken care of via the choice of Green's function This book discusses in detail how to solve the integral equations using either simple or higher order finite element based methods how to calculate the relevant Green's function for different reference structures and choices of boundary conditions and how to calculate near fields optical cross sections and the power emitted by a local source Solution strategies for large structures are discussed based on either transfer matrix approaches or the conjugate gradient algorithm combined with the Fast Fourier Transform Special attention is given to reducing the computational problem for three dimensional structures with cylindrical symmetry by using cylindrical harmonic expansions Each presented method is accompanied by examples from nano optics including resonant metal nano particles placed in a homogeneous medium or on a surface or waveguide a microstructured gradient index lens the Purcell effect for an emitter in a photonic crystal the excitation of surface plasmon polaritons by second harmonic generation in a polymer fiber placed on a thin metal film and anti reflective broadband absorbing or resonant surface microstructures Each presented method is also accompanied by guidelines for software implementation and exercises Features Comprehensive introduction to Green's function integral equation methods for scattering problems in the field of nano optics Detailed explanation of how to discretize and solve integral equations using simple and higher order finite element approaches Solution strategies for large structures Guidelines for software implementation and exercises Broad selection of examples of scattering problems in nano optics
