Topical Drug Bioavailability, Bioequivalence, and Penetration Vinod P. Shah, Howard I. Maibach, John Jenner, 2015-01-30 This authoritative volume explores advances in the techniques used to measure percutaneous penetration of drugs and chemicals to assess bioavailability and bioequivalence and discusses how they have been used in clinical and scientific investigations Seven comprehensive sections examine topics including in vitro drug release topical drugs products clinical studies and guidelines and workshop reports among others The

book also describes how targeted transdermal drug delivery and more sophisticated mathematical modelling can aid in understanding the bioavailability of transdermal drugs The first edition of this book was an important reference guide for researchers working to define the effectiveness and safety of drugs and chemicals that penetrated the skin This second edition contains cutting edge advances in the field and is a key resource to those seeking to define the bioavailability and bioequivalence of percutaneously active compounds to improve scientific and clinical investigation and regulation

Dermato-pharmacokinetics Lisa Maria Russell, 2009 Skin more specifically the outermost skin layer the stratum corneum SC forms an extremely effective barrier preventing both the loss of heat and water and the ingress of micro organisms and chemicals Assessing the rate and extent of drug permeation into or through the skin is important both to evaluate the usefulness of a drug for topical or transdermal delivery and to compare different formulations to assess their bioequivalence Prediction of drug permeation is logistically ethically and economically preferable to in vivo measurements The recent progress that has been made with empirical and mechanistic mathematical models along with in vitro diffusion cell techniques has been reviewed However currently in vivo measurements in man are still required For new chemical entities the need for clinical trials is clear In the case of generic products however there is considerable effort currently being expended to replace expensive subjective clinical trials with objective validated measurements of drug permeation in vivo in particular to assess bioequivalence The tape stripping technique has emerged as a promising technique to objectively measure drug permeation through skin and is the focus of this thesis After formulation application and removal layers of SC are sequentially removed by adhesive tapes As the SC performs the main barrier function of the skin measuring the rate and extent of drug permeation through this layer is assumed to be related to overall topical bioavailability The work in this thesis concentrates on performing tape stripping studies such that all tapes are analysed individually and drug concentration as a function of SC depth is measured The concentration depth profiles across the SC may be fitted to an appropriate solution of Fick's second law of diffusion to obtain estimates of the vehicle SC partition coefficient and the drug's diffusivity in the membrane These dermato pharmacokinetic parameters may be compared for different formulations
