An Introduction to Analysis Arlen Brown, Carl Pearcy, 2012-12-06 As its title indicates this book is intended to serve as a textbook for an introductory course in mathematical analysis. In preliminary form the book has been used in this way at the University of Michigan, Indiana University and Texas A M University and has proved serviceable. In addition to its primary purpose as a textbook for a formal course however it is the authors' hope that this book will also prove of value to readers interested in studying mathematical analysis on their own. Indeed we believe the wealth and variety of examples and exercises will be especially conducive to this end. A word on prerequisites: With what mathematical background might a prospective reader hope to profit from the study of this book? Our conscious intent in writing it was to address the needs of a beginning graduate student in mathematics or to put matters slightly differently a student who has completed an undergraduate program with a mathematics major. On the other hand the book is very largely self contained and should therefore be accessible to a lower classman whose interest in mathematical analysis has already been awakened.

Mathematical Analysis Andrew Browder, 2012-12-06 This is a textbook suitable for a year long course in analysis at the advanced undergraduate or possibly beginning graduate level. It is intended for students with a strong background in calculus and linear algebra and a strong motivation to learn mathematics for its own sake. At this stage of their education such students are generally given a course in abstract algebra and a course in analysis which give the fundamentals of these two areas as mathematicians today conceive them. Mathematics is now a subject splintered into many specialties and sub specialties but most of it can be placed roughly into three categories: algebra, geometry and analysis. In fact almost all mathematics done today is a mixture of algebra, geometry and analysis and some of the most interesting results are obtained by the application of analysis to algebra or geometry to analysis in a fresh and surprising way. What then do these categories signify? Algebra is the mathematics that arises from the ancient experiences of addition and multiplication of whole numbers; it deals with the finite and discrete. Geometry is the mathematics that grows out of spatial experience; it is concerned with shape and form and with measuring where algebra deals with counting.
