## **Verifying Greenhouse Gas Emissions Verifying Greenhouse Gas Emissions:**

**Verifying Greenhouse Gas Emissions** National Research Council, Division on Earth and Life Studies, Board on Atmospheric Sciences and Climate, Committee on Methods for Estimating Greenhouse Gas Emissions, 2010-07-28 The world's nations are moving toward agreements that will bind us together in an effort to limit future greenhouse gas emissions. With such agreements will come the need for all nations to make accurate estimates of greenhouse gas emissions and to monitor changes over time. In this context the present book focuses on the greenhouse gases that result from human activities, have long lifetimes in the atmosphere and thus will change global climate for decades to millennia or more and are currently included in international agreements. The book devotes considerably more space to CO<sub>2</sub> than to the other gases because CO<sub>2</sub> is the largest single contributor to global climate change and is thus the focus of many mitigation efforts. Only data in the public domain were considered because public access and transparency are necessary to build trust in a climate treaty. The book concludes that each country could estimate fossil fuel CO<sub>2</sub> emissions accurately enough to support monitoring of a climate treaty. However, current methods are not sufficiently accurate to check these self-reported estimates against independent data or to estimate other greenhouse gas emissions. Strategic investments would within 5 years improve reporting of emissions by countries and yield a useful capability for independent verification of greenhouse gas emissions reported by countries.

**Verifying Greenhouse Gas Emissions, 2010 Monitoring, Measurement, and Verification of Greenhouse Gas Emissions, Parts I and II** United States. Congress. House. Committee on Science and Technology (2007). Subcommittee on Energy and Environment, 2009 *A Strategy for a Global Observing System for Verification of National Greenhouse Gas Emissions* Ronald G. Prinn, Patrick Heimbach, Matthew Rigby, Stephanie Dutkiewicz, Jerry M. Melillo, John Matthew Reilly, David W. Kicklighter, Caleb Joseph Waugh, Massachusetts Institute of Technology. Joint Program on the Science & Policy of Global Change, 2011 With the risks of climate change becoming increasingly evident there is growing discussion regarding international treaties and national regulations to lower greenhouse gas (GHG) emissions. Enforcement of such agreements is likely to depend formally upon national and sectoral emission reporting procedures, sometimes referred to as bottom up methods. However, for these procedures to be credible and effective it is essential that these reports or claims be independently verified. In particular, any disagreements between these bottom up emission estimates and independent emission estimates inferred from global GHG measurements, so called top down methods, need to be resolved. Because emissions control legislation is national or regional in nature, not global, it is also essential that top down emission estimates be determined at these same geographic scales. This report lays out a strategy for quantifying and reducing uncertainties in greenhouse gas emissions based on a comprehensive synthesis of global observations of various types, with models of the global cycles of carbon dioxide and other greenhouse gases that include both the natural and human influences on these cycles. The overall goal is to establish a global observing and estimation system that incorporates all

relevant available knowledge physical biogeochemical technological and economic in order to verify greenhouse gas emissions as a key component of any global GHG treaty

**An Approach for Verifying Biogenic Greenhouse Gas Emissions Inventories with Atmospheric CO<sub>2</sub> Concentration Data**, 2015 Verifying national greenhouse gas GHG emissions inventories is a critical step to ensure that reported emissions data to the United Nations Framework Convention on Climate Change UNFCCC are accurate and representative of a country's contribution to GHG concentrations in the atmosphere Verification could include a variety of evidence but arguably the most convincing verification would be confirmation of a change in GHG concentrations in the atmosphere that is consistent with reported emissions to the UNFCCC We report here on a case study evaluating this option based on a prototype atmospheric CO<sub>2</sub> measurement network deployed in the Mid Continent Region of the conterminous United States We found that the atmospheric CO<sub>2</sub> measurement data did verify the accuracy of the emissions inventory within the confidence limits of the emissions estimates suggesting that this technology could be further developed and deployed more widely in the future for verifying reported emissions
