

Unit 4: Evolution

Study Guide

57L5: Obtain, evaluate, and communicate information from multiple sources to explain the theory of evolution of living organisms through inherited characteristics.

Vocabulary: Complete the following chart using the definitions obtained in class.

Word	Definition
Fossil	The trace or remains of an organism that lived long ago most commonly preserved in sedimentary rock.
Adaptation	A characteristic that improves an individual's ability to survive and reproduce in a particular environment.
Ancestor	A person from who you are descendant.
Evolution	The process in which inherited characteristics within a population change over time.
Mutation	A change in the DNA.
Acquired Trait	A learned trait.
Natural Selection	The process by which individuals that are better adapted to their environment survive better than less well adapted individuals.
Variation	A difference or deviation in structure from other in the same species or group.
Speciation	The formation of new species as a result of evolution.
Geographic Speciation	The formation of a new species as a result of a group being separated by a physical barrier.
Fitness	An organism's ability to survive and reproduce in a particular environment.

57L5a: Use mathematical representations to evaluate explanations of how natural selection leads to changes in specific traits of populations over successive generations.

During the Industrial Revolution in England, soot and other industrial wastes darkened tree trunks and killed off lichen. The light colored variation of the peppered moth became rare and the dark colored variation became more abundant. Eventually, light colored variations were common in only a few areas, far from industrial areas. In the 1930's, biologist Kettlewell did an experiment using both variations of peppered moths. Use the data below to answer the following questions:

	Light moth	Dark moth
Non-industrial woods	14.6%	4.7%
Industrial woods	13%	97.5%

1. What does the data suggest about the number of light colored moths vs. dark colored moths in each of the locations?

The data suggest that the light colored moths are more abundant in non-industrial woods and less in industrial woods. On the other hand, the dark colored moths are more abundant in the industrial woods and less in non-industrial woods.

2. What is meant by "non-industrial woods"? "Industrial woods"?

Non-industrial woods are woods that do not have soot or industrial waste to darken the trees. Industrial woods are those that have been darkened by soot and other industrial waste.

George Karleskint,1991 **Identification and Characterization of Neural Progenitor Cells in the Adult Mammalian Brain** Sara Gil-Perotín,Arturo Alvarez-Buylla,Jose Manuel Garcia-Verdugo,2009-04-21 Adult neurogenesis has been questioned for many years In the early 1900s a dogma was established that denied new neuron formation in the adult brain In the last century however new discoveries have demonstrated the real existence of proliferation in the adult brain and in the last decade these studies led to the identification of neural stem cells in mammals Adult neural stem cells are undifferentiated cells that are present in the adult brain and are capable of dividing and differentiating into glia and new neurons Newly formed neurons terminally differentiate into mature neurons in the olfactory bulb and the dentate gyrus of the hippocampus Since then a number of new research lines have emerged whose common objective is the phenotypical and molecular characterization of brain stem cells As a result new therapies are successfully being applied to animal models for certain neurodegenerative diseases or stroke At present and in years to come this finding extends to the adult human brain and gives reason and hope to all the previous studies **Archaeological Concepts, Techniques, and Terminology for**

Connectivity Viktor K. Jirsa,A.R. McIntosh,2007-08-16 Our contemporary understanding of brain function is deeply rooted in the ideas of the nonlinear dynamics of distributed networks Cognition and motor coordination seem to arise from the interactions of local neuronal networks which themselves are connected in large scales across the entire brain The spatial architectures between various scales inevitably influence the dynamics of the brain and thereby its function But how can we integrate brain connectivity amongst these structural and functional domains Our Handbook provides an account of the current knowledge on the measurement analysis and theory of the anatomical and functional connectivity of the brain All contributors are leading experts in various fields concerning structural and functional brain connectivity In the first part of the Handbook the chapters focus on an introduction and discussion of the principles underlying connected neural systems The second part introduces the currently available non invasive technologies for measuring structural and functional connectivity in the brain Part three provides an overview of the analysis techniques currently available and highlights new
