Uniform System for the Rapid Prototyping and Testing of Controllers for Unmanned Aerial Vehicles James A.

Zanino,1996-09-01 The field of control systems has witnessed an explosion in state space techniques addressing a variety of critical design issues facing control engineers today Modern computational tools such as the MATRIX x Product Family developed by Integrated Systems Incorporated allow the designer to quickly design test and implement control systems based on these state space techniques These new computing advances shorten the time required to complete a control design from a few years to a few months However as the design process progressed new inputs and outputs were required which usually resulted in a confusing mess of connections that were hard to follow Therefore a universal system was needed that could be used on any controller design to aid in the understanding and tracking of the controller's inputs and outputs A description of this system is given along with a detailed step by step process on how it was implemented on a Unmanned Air Vehicle UAV

Animal Locomotion Graham Taylor, Michael S. Triantafyllou, Cameron Tropea, 2010-03-20 The physical principles of swimming and flying in animals are intriguingly different from those of ships and airplanes The study of animal locomotion therefore holds a special place not only at the frontiers of pure fluid dynamics research but also in the applied field of biomimetics which aims to emulate salient aspects of the performance and function of living organisms For example fluid dynamic loads are so significant for swimming fish that they are expected to have developed efficient flow control procedures through the evolutionary process of adaptation by natural selection which might in turn be applied to the design of robotic swimmers And yet sharply contrasting views as to the energetic efficiency of oscillatory propulsion especially for marine animals demand a careful assessment of the forces and energy expended at realistic Reynolds numbers For this and many other research questions an experimental approach is often the most appropriate methodology This holds as much for flying animals as it does for swimming ones and similar experimental challenges apply studying tethered as opposed to free locomotion or studying the flow around robotic models as opposed to real animals This book provides a wide ranging snapshot of the state of the art in experimental

research on the physics of swimming and flying animals The resulting picture reflects not only upon the questions that are of interest in current pure and applied research but also upon the experimental techniques that are available to answer them
