Visuomotor Coordination Amphibians Comparisons Models And Robots:

Visuomotor Coordination Jorg Peter Ewert, Michael A. Arbib, 2013-06-29 Various brain areas of mammals can phylogenetically be traced back to homologous structures in amphibians The amphibian brain may thus be regarded as a kind of microcosm of the highly complex primate brain as far as certain homologous structures sensory functions and assigned ballistic pre planned and pre programmed motor and behavioral processes are concerned A variety of fundamental operations that underlie perception cognition sensorimotor transformation and its modulation appear to proceed in primate s brain in a way understandable in terms of basic principles which can be investigated more easily by experiments in amphibians We have learned that progress in the quantitative description and evaluation of these principles can be obtained with guidance from theory Modeling supported by simulation is a process of transforming abstract theory derived from data into testable structures Where empirical data are lacking or are difficult to obtain because of structural constraints the modeler makes assumptions and approximations that by themselves are a source of hypotheses If a neural model is then tied to empirical data it can be used to predict results and hence again to become subject to experimental tests whose resulting data in turn will lead to further improvements of the model By means of our present models of visuomotor coordination and its modulation by state dependent inputs we are just beginning to simulate and analyze how external information is represented within different brain structures and how these structures use these operations to control adaptive behavior *Visual Structures and Integrated Functions* Michael A. Arbib, Jörg-Peter Ewert, 2012-12-06 This volume integrates theory and experiment to place the study of vision within the context of the action systems which use visual information This theme is developed by stressing a The importance of situating any part of the brain in the context of its interactions with other parts of the brain in subserving animal behavior The title of this volume emphasizes that visual function is to be viewed in the context of the integrated functions of the organism b Both the intrinsic interest of frog and toad as animals in which to study the neural mechanisms of visuomotor coordination and the importance of comparative studies with other organisms so that we may learn from an analysis of both similarities and differences The present volume thus supplements our studies of frog and toad with papers on salamander bird and reptile turtle rat gerbil rabbit and monkey c Perhaps most distinctively the interaction between theory and experiment

Neural Networks in Robotics George A. Bekey, Kenneth Y. Goldberg, 2012-12-06 Neural Networks in Robotics is the first book to present an integrated view of both the application of artificial neural networks to robot control and the neuromuscular models from which robots were created The behavior of biological systems provides both the inspiration and the challenge for robotics The goal is to build robots which can emulate the ability of living organisms to integrate perceptual inputs smoothly with motor responses even in the presence of novel stimuli and changes in the environment The ability of living systems to learn and to adapt provides the standard against which robotic systems are judged In order to emulate these abilities a number of investigators have attempted to create

robot controllers which are modelled on known processes in the brain and musculo skeletal system Several of these models are described in this book On the other hand connectionist artificial neural network formulations are attractive for the computation of inverse kinematics and dynamics of robots because they can be trained for this purpose without explicit programming Some of the computational advantages and problems of this approach are also presented For any serious student of robotics Neural Networks in Robotics provides an indispensable reference to the work of major researchers in the field Similarly since robotics is an outstanding application area for artificial neural networks Neural Networks in Robotics is equally important to workers in connectionism and to students for sensorimotor control in living systems **Current**
