

CHAPTER 1

Biochemistry and the Organization of Cells

LEARNING TARGETS:

At the end of the lesson, the students can:

- ☐ Define biochemistry and identify its relationship to living organisms.
- ☐ Differentiate the two types of biochemical substances.
- ☐ Compare and contrast eukaryotes from prokaryotes.
- ☐ Identify and enumerate the different parts and functions of a eukaryotic cell.

What is BIOCHEMISTRY?

One of the most important themes in biochemistry is describing life processes. All organisms whether they are consist of small cells such as a bacterium or composed of different cells such as human beings are said to be complex. However, there are certain unifying features that are common to all living things – they all use the same types of biomolecules, and they use energy. Hence, all organisms can be studied through the method of chemistry which is known as biochemistry.

Biochemistry is the study of chemical substances found in living organisms and the chemical interactions of these substances with each other. It is a field in which new discoveries are made almost daily about how cells manufacture the molecules needed for life and how the chemical reactions by which life is maintained occur.

A biochemical substance or a biomolecule is a chemical substance that is found within an organism. Biochemical substances are divided into two major categories: bioinorganic substances and bioorganic substances. Bioinorganic substances include water and inorganic salts while bioorganic substances include carbohydrates, lipids, proteins, and nucleic acids. The figure below shows the approximate mass composition of the different types of biochemical substances present in the human body.
