China's Uneven and Combined Development Steven Rolf, 2020-10-15 This book mobilises the theory of uneven and combined development to uncover the geopolitical economic drivers of China's rise The purpose is to explain the formation and trajectory of its economic accumulation system which remains a confounding hybrid of statist and neoliberal forms of capitalism as the outcome of China's geopolitical engagement of the USA during the late stages of the Cold War and its participation in manufacturing global production networks GPNs Fear of geopolitical catastrophe drove China to open its economy while GPNs enabled China to generate substantial export surpluses which could be recycled through state owned banks as cheap credit and subsidies to large vertically integrated and politically controlled state owned enterprises In this way a synergy emerged between the neoliberal and Keynesian Fordist sectors of the economy while the national territorial state retained its form and expanded its functions The book chronicles how this reliance on export surpluses however rendered China extremely vulnerable to external shocks prompting a dramatic monetary and fiscal stimulus response to the crisis of 2008 even while sustaining the illusion of economic decoupling from the global economy Finally it examines the growing role of the state in the current crisis ridden economic model as well as China's current geoeconomic and geopolitical expansionism in areas such as the Belt and Road Initiative and the militarisation of the East and South China Seas

Kerner, 2017-05-26 This book offers a detailed investigation of breakdowns in traffic and transportation networks It shows empirically that transitions from free flow to so called synchronized flow initiated by local disturbances at network bottlenecks display a nucleation type behavior while small disturbances in free flow decay larger ones grow further and lead to breakdowns at the bottlenecks Further it discusses in detail the significance of this nucleation effect for traffic and transportation theories and the consequences this has for future automatic driving traffic control dynamic traffic assignment and optimization in traffic and transportation networks Starting from a large volume of field traffic data collected from various sources obtained solely through measurements in real world traffic the author develops his insights with an emphasis less on reviewing existing methodologies models and theories and more on providing a detailed analysis of empirical traffic data and drawing consequences regarding the minimum requirements for any traffic and transportation

theories to be valid The book proves the empirical nucleation nature of traffic breakdown in networks discusses the origin of the failure of classical traffic and transportation theories shows that the three phase theory is incommensurable with the classical traffic theories and explains why current state of the art dynamic traffic assignments tend to provoke heavy traffic congestion making it a valuable reference resource for a wide audience of scientists and postgraduate students interested in the fundamental understanding of empirical traffic phenomena and related data driven phenomenology as well as for practitioners working in the fields of traffic and transportation engineering [Springer Handbook of Systematic Musicology](#)
