Discoveries in Photosynthesis Govindjee, J.T. Beatty, H. Gest, J.F. Allen, 2006-07-15 Life Is Bottled Sunshine Wynwood Reade Martyrdom of Man 1924 This inspired phrase is a four word summary of the significance of photosynthesis for life on earth The study of photosynthesis has attracted the attention of a legion of biologists biochemists chemists and physicists for over 200 years Discoveries in Photosynthesis presents a sweeping overview of the history of photosynthesis investigations and detailed accounts of research progress in all aspects of the most complex bioenergetic process in living organisms Conceived of as a way of summarizing the history of research advances in photosynthesis as of millennium 2000 the book evolved into a majestic and encyclopedic saga involving all of the basic sciences The book contains 111 papers authored by 132 scientists from 19 countries It includes overviews timelines tributes minireviews on excitation energy transfer reaction centers oxygen evolution light harvesting and pigment protein complexes electron transport and ATP synthesis techniques and applications biogenesis and membrane architecture reductive and assimilatory processes transport regulation and adaptation Genetics and Evolution laboratories and national perspectives and retrospectives that end in a list of photosynthesis symposia books and conferences Informal and formal photographs of scientists make it a wonderful book to have This book is meant not only for the researchers and graduate students but also for advanced undergraduates in Plant Biology Microbiology Cell Biology Biochemistry Biophysics and History of Science

Chloroplast Biogenesis Neil R. Baker, James Barber, 1984

Division and Segregation of Organelles Stephen A. Boffey, David Lloyd, 1988 These editors provide a stimulating survey of the ways in which mitochondria plastids and other cellular organelles replicate The orderly division and segregation of these organelles is essential for the survival of all eukaryotes and is therefore a topic of importance to a wide range of biologists

from geneticists via physiologists to molecular biologists The first part of the volume examines the mechanism regulation and consequences of organelle segregation and division as studied in plant and animal cells The second part compares the replication of DNA in eukaryote organelles with bacterial processes Reviews range from a comparative study of DNA polymerases to the possible mechanisms ensuring DNA segregation Chloroplast Biogenesis James Barber, Neil R. Baker, 1984 *Plant Promoters and Transcription Factors* Lutz Nover, 2013-06-29 The control of plant gene expression at the transcriptional level is the main subject of this volume Genetics molecular biology and gene technology have dramatically improved our knowledge of this event The functional analysis of promoters and transcription factors provides more and more insights into the molecular anatomy of initiation complexes assembled from RNA polymerase and the multiplicity of helper and control proteins Formation of specific DNA protein complexes activating or repressing transcription is the crux of developmental or environmental control of gene expression The book presents an up to date critical overview of this rapidly advancing field Plant Organelles Alyson K. Tobin, 1992-10-15 A comprehensive review of current research on the interaction of plant organelles in photosynthesis photorespiration substrate and protein transport respiration lipid metabolism and organelle biogenesis *Control of Leaf Growth* N. R. Baker, W. J. Davies, C. K. Ong, 1985 First published in 1985 this book covers the physiological and environmental factors that regulate leaf growth It opens with a consideration of the importance to the plant of leaf size form and development and then divides naturally into two sections the first covers the intrinsic factors within the leaf that influence development including solute and hormonal status cellular components and energy transducing systems the second considers the role of some major environmental variables in the regulation of leaf growth including temperature light water and nutrients atmospheric influences and the interactive effects of climatic variables Compartmentation of Plant Metabolism in Non-Photosynthetic Tissues M. J. Emes, 1991-02-21 Many of the most important plant crop products including oils starch and protein are produced in non photosynthetic tissues such as seeds roots and tubers Unlike the situation found in leaves metabolism in these tissues is not necessarily dominated by plastidial activities and the provision of energy for biosynthetic processes is therefore different from that in green cells In this book leading researchers in the field present a fine overview of the latest thinking on the organisation of metabolism in such organs and the development of the cellular compartments responsible for the synthesis of important crop products Graduate students as well as researchers in the field of plant biochemistry will find this book of great interest
