

ROLLING ELEMENT BEARING FAILURE MODES

Rolling element bearings are subject to a wide range of failure modes. The most common failure mode is fatigue, which is caused by the repeated loading of the bearing surfaces. Other failure modes include corrosion, misalignment, and lubrication failure.

Rolling element bearings can be classified into two main types: deep groove ball bearings and tapered roller bearings. Each type has its own set of failure modes and symptoms.

Rolling element bearings can be inspected visually for signs of failure. Common signs include discoloration, pitting, and scoring. More advanced inspection techniques, such as vibration analysis, can also be used to detect bearing failure.

Rolling element bearings should be replaced when they show signs of failure. It is important to replace the bearing as soon as possible to avoid further damage to the machine.

Rolling element bearings should be replaced with the same type and size of bearing. It is also important to ensure that the new bearing is properly lubricated and aligned.
