Whole Life Cycle Costing Whole Life Cycle Costing:

Whole Life-Cycle Costing Abdelhalim Boussabaine, Richard Kirkham, 2008-04-15 Whole life cycle costing WLCC is rapidly becoming the standard method for the long term cost appraisal of buildings and civil infrastructure projects With clients now demanding buildings that demonstrate value for money over the long term WLCC has become an essential tool for those involved in the design construction operation and risk analysis of construction projects Whole life costing risk and risk responses offers a thorough grounding in both the theory and practical application of WLCC Part I deals with the fundamentals providing the general background to appreciate WLCC concepts and whole life risk management techniques at the key decision making milestones through a project's life Part II covers the design stage including service life forecasting and environmental life cycle assessment techniques in WLCC Practical frameworks both for assessing whole life risks and risk responses as well as guidance on developing WLCC budget estimates are also developed In Part III the authors consider WLCC during the construction and operations stages with a strong emphasis upon risk analysis methods and dynamic WLCC assessment With its mixture of established theory best practice and innovative approaches this book will help you make more accurate assessments of the long term cost effectiveness of projects by providing a thorough grounding in the theory of WLCC demonstrating how decision making uncertainty can be reduced by basing choices on sound risk management principles identifying a systematic approach to planning the post occupancy costs *Life Cycle Costing* Subramanian Senthilkannan Muthu, 2023-10-09 Life Cycle Costing LCC is a well known and popular method to evaluate the economic sustainability which as the term implies is structured on the life cycle of a product or process LCC is a method primarily consisting of estimating the total cost of a product taking into account the whole life cycle of the product as well as the direct and external costs It is one of the important methods and tools under the sustainability umbrella This book describes the concept of LCC and offers several interesting case studies Whole Life Costing for Sustainable Building Mariana Trusson, 2019-11-05 Whole life costing is now integral to building procurement both for new buildings and major refurbishments It is key when assessing investment scenarios for estates as well as individual buildings and has become a tool for justifying higher capital cost items Standard whole life costing methods combine capital cost facilities costs operational costs income and disposal costs with a single action single benefit approach Costing based on this type of single attribute assessment misses out on realising value from the intricacies of the interactions buildings have with their occupants users and the location in which they are placed In contrast the multi attribute approach presented by the author of this book explains how to analyse the whole cost of a building while also taking into account secondary and tertiary values of a variety of actions that are deemed important for the project owners and decision making stakeholders The process is an effective tool for presenting a good business case within the opportunities and constraints of real life For example it presents the interdependencies of how Building location affects servicing strategies which impact on maintainability and control and by

extension on occupant comfort Material selection affects time on site building maintainability as well as overall building quality and the environment Building shape impacts on servicing strategies as well as operating costs The reader will be shown how to incorporate this method of whole life valuation into standard cost models allowing for a more robust decision making process This is done by breaking down project aims into their most basic aspects and adopting the methods of simple quantitative risk analysis the functionality of which is based on real data Written by an author immersed in project team collaboration to identify the interdependencies of design decisions throughout her professional life this is the most practical guide available on the topic *Life Cycle Costing for Engineers* B.S. Dhillon,2009-10-26 Cradle to grave analyses are becoming the norm as an increasing amount of corporations and government agencies are basing their procurement decisions not only on initial costs but also on life cycle costs And while life cycle costing has been covered in journals and conference proceedings few if any books have gathered this information into an *Life Cycle Costing* Subramanian Senthilkannan Muthu,2025-07-29 This volume offers several case studies detailing Life Cycle Assessment practices across a variety of industries Particular focus is placed on materials used in renewable energy efforts and in buildings and construction This volume can be of use to academics students professionals and anyone else interested in making industry more sustainable *Life Cycle Costing* John W. Bull,2015 The key areas of life cycle cost analysis LCCA and whole life costing WLC are exemplified in this volume with accounts of their application to housing stock a community hydroelectric power system various aspects of highway infrastructure and corrosion protective coatings Sustainable construction and design requires more than compliance with safety requirements and economic constraints there is also the impact on the environment the surrounding population and users of the infrastructure This requires a multidimensional perspective of sustainability to be considered in life cycle costing LCC combining current design criteria with these other aspects It has become increasingly important to understand the full costs of civil engineering infrastructure and the main sources of cost along the whole supply chain and to identify cost reduction opportunities The conventional procurement approach without the integration of probabilistic life cycle cost modelling induces substantial long term maintenance costs Once deterioration and life cycle cost models have been established appropriate partnership procurement strategies associated financing methods and determination of the project period can be developed LCC includes the cost of planning design acquisition operation maintenance and disposal of buildings and other construction assets while WLC additionally includes incomes and other costs such as non construction costs and externalities In whole life costing social environmental or business costs or benefits are considered as externalities and care must be taken not to double count the impacts when WLC is used together with LCCA The international examples included in this book illustrate practically the methodology of life cycle costing and the application of life cycle cost analysis to identify the most appropriate method for assessing the relative merits of competing project implementation alternatives *Systems Lifecycle Cost-Effectiveness* Massimo Pica,2016-04-01

Traditional costing models for new systems and new buildings in industry defence or government have tended to focus on the costs of acquisition and implementation with scant regard for the costs of running the system or decommissioning after use. The pressure to minimize expenditure and provide value for money from reduced resources means that complex projects have to encompass a wide range of often conflicting issues and interests. Systems Lifecycle Cost Effectiveness shows how to manage the difficulties that can arise. Optimizing the system lifecycle cost effectiveness is complex and influenced by many factors. Massimo Pica presents a variety of models for calculating cost benefits and risk in projects and explains how the human factors associated with a system's design and consequent value are as important as the technical costs associated with its construction or creation. This comprehensive text can be used by students, experienced system engineers, cost analysts and managers to improve their understanding of the wide range of issues involved in the evaluation of system life cycle cost effectiveness.
